Package 'GCDkit'

June 5, 2013

Version 3.00

Date 2013-05-11

Title Geochemical Data Toolkit for Windows

Author Vojtech Janousek <vojtech.janousek@geology.cz>
Colin Farrow <colinfarrow537@gmail.com>
Vojtech Erban <vojtech.erban@geology.cz>
Jean-Francois Moyen <jfmoyen@gmail.com>

Maintainer Vojtech Janousek <vojtech.janousek@geology.cz>

Depends R (>= 2.13.0), stats, methods, utils, graphics, MASS, grid, lattice, foreign, RODBC, R2HTML, tcltk, sp

Description A program for recalculation of geochemical data from igneous and metamorphic rocks. Runs under Windows Vista/7/8, complete function/stability under 2000/NT/XP cannot be guaranteed.

License GPL Version 2 or later.

URL http://www.gcdkit.org

R topics documented:

.claslist *List of available classification schemes*

Description

The function returns a list of classification diagrams available in the system.

Usage

```
.claslist()
```

Value

A matrix with two columns:

`menu`	menu items
`function`	the attached functions

Author(s)

Vojtech Erban, <vojtech.erban@geology.cz>

about *About GCDkit*

Description

Prints short information about the current version of GCDkit and contact addresses of its authors.

Usage

```
about()
```

Arguments

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

accessVar *Accessing data in memory of R*

Description

Loads data already present in memory of R into GCDkit.

Usage

```
accessVar(var=NULL)
```

Arguments

var	a text string specifying the variable to be accessed

Details

This function makes possible to access a variable, already present in R, most importantly the sample data sets. Firstly these need to be made available using the command `data`.

Value

WR	numeric matrix: all numeric data
labels	data frame: all at least partly character fields; `labels$Symbol` contains plotting symbols and `labels$Colour` the plotting colours

The function prints a short summary about the attached data. It also loads and executes the Plugins, i.e. all the R code that is currently stored in the subdirectory '`\Plugin`'.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
data(swiss)
accessVar("swiss")
binary("Catholic","Education")

data(sazava)
accessVar("sazava")
binary("SiO2","Ba")
```

`Add contours` *Add contours*

Description

Superposes contour lines to a Figaro-compatible plot.

Usage

```
addContours()
```

Details

This is, in principle, a front end to the standard R function `contour`.

Value

None.

Author(s)

Vojtech Erban, `<vojtech.erban@geology.cz>`

See Also

'`filled.contour`''`figaro`'

`addResults` *Appending results to data*

Description

Appends the most recently calculated results to the data stored in memory.

Usage

```
addResults(what="results", save=TRUE)
```

Arguments

`what`	character; the name of variable to be appended.
`save`	logical; Append to the data matrix '`WR`'?.

Details

This function appends the variable '`results`' (a matrix or vector) returned by most of the calculation algorithms to a the numeric data stored in the matrix '`WR`'.

Value

Modifies the matrix '`WR`'.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

`addResultsIso` *Append Sr-Nd isotopic data*

Description

Appends the calculated isotopic parameters stored in the matrix 'init' to the numeric data already in the system.

Usage

```
addResultsIso()
```

Value

Modifies the numeric data matrix('WR') to which it appends the following columns:

`Age (Ma)`	Age in Ma
`87Sr/86Sri`	Sr isotopic ratios
`143Nd/144Ndi`	Initial Nd isotopic ratios
`EpsNdi`	Initial $\epsilon(Nd)$ values
`TDM`	Single-stage depleted-mantle Nd model ages *(Liew & Hofmann, 1988)*
`TDM.Gold`	Single-stage depleted-mantle Nd model ages *(Goldstein et al., 1988)*
`TDM.2stg`	Two-stage depleted-mantle Nd model ages *(Liew & Hofmann, 1988)*

Plugin

'addResults'

AFM *AFM diagram (Irvine + Baragar 1971)*

Description

Assigns data for AFM ternary diagram into Figaro template (list 'sheet') and appropriate values into 'x.data' and 'y.data'.

Usage

```
AFM(equ=FALSE)
```

Arguments

equ	Logical: Should the template use boundary defined by equation?

Details

The AFM diagram is a triangular plot with apices A, F and M defined as follows:

A = $(K_2O + Na_2O)$ wt. %

F = FeOtot wt. %

M = MgO wt. %

A + F + M = 100 %

The classification diagram divides data into 'tholeiite series' and 'calc-alkaline series' as proposed by *Irvine & Baragar (1971)*. For extreme values linear extrapolation of boundary curve is employed.

Value

sheet	list with Figaro Style Sheet data
x.data, y.data	A, F, M values (see details) transformed into 2D

Author(s)

Vojtech Erban, <vojtech.erban@geology.cz>
& Vojtech Janousek, <vojtech.janousek@geology.cz>

classify figaro plotDiagram

Examples

```
#Within GCDkit, AFM is called using following auxiliary functions:
#To Classify data stored in WR (Groups by diagram)
classify("AFM")

#To plot data stored in WR or its subset (menu Classification)
plotDiagram("AFM", FALSE)
```

`ageEps` *Plot Sr or Nd growth lines*

Description

Plots Nd or Sr growth curves in the binary diagram age-$\epsilon(Nd)$ or age-Sr isotopic ratio.

Usage

```
ageEps()

ageEps2()

ageSr()
```

Arguments

None.

Details

The Nd growth curves in individual samples can be plotted using either a single- or two-stage *(Liew & Hofmann 1988)* models.

In case of Nd are shown growth curves for the two main mantle reservoirs, CHUR and Depleted Mantle (DM) (the latter in two modifications, after *Goldstein et al. (1988)* and *Liew & Hofmann (1988)*.

For Sr only uniform reservoir (UR) development is calculated using parameters of *Faure (1986 and references therein)*.

The small ticks, or rugs, on x axis correspond to Nd model ages, on y axis to initial $\epsilon(Nd)$ values.

This function is, so far with the exception of rugs, Figaro compatible.

Value

None.

Plugin

SrNd.r

`Agrawal` *Trace-element based discrimination plots for (ultra-)basic rocks (Agrawal et al. 2008)*

Description

Plots data stored in '`WR`' into discrimination plots proposed by *Agrawal et al. (2008)* for (ultra-) basic rocks (SiO_2 < 52 wt. %).

Usage

```
Agrawal(plot.txt = getOption("gcd.plot.text"))
```

Arguments

`plot.txt`	logical, annotate fields by their names?

Details

Suite of five diagrams for discrimination of geotectonic environment of ultrabasic and basic rocks, proposed by *Agrawal et al. (2008)*. It is based on linear discriminant analysis applied to log-transformed concentration ratios of five trace elements (La, Sm, Yb, Nb, and Th), i.e., using four ratios $ln(La/Th)$, $ln(Sm/Th)$, $ln(Yb/Th)$, and $ln(Nb/Th)$. The two discriminant functions, DF1 and DF2, are mathematically designed to maximize the separation between the groups and account for 100 percent of the variance in the data.

Note that only samples with SiO_2 < 52 wt. % are plotted.

Also note that each diagram applies only to environments explicitly mentioned. Samples from the environment not taken into account will be misinterpreted (the CRB + OIB + MORB diagram is not designed for IAB etc.) See the Agrawal et al (2008) for further details.

Following geotectonic settings may be deduced:

Abbreviation used	Environment
IAB	*island arc basic rocks*
CRB	*continental rift basic rocks*
OIB	*ocean-island basic rocks*
MORB	*mid-ocean ridge basic rocks*

Value

None.

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

Ague *Concentration ratio diagram (Ague 1994)*

Description

Implementation of Concentration ratio diagrams after *Ague (1994)* used for judging the mobility of elements or oxides in course of various geochemically open-system processes such as alteration or partial melting.

Usage

```
Ague(x = NULL,
whichelems = "SiO2,TiO2,Al2O3,FeOt,MnO,MgO,CaO,Na2O,K2O,P2O5",
immobile = NULL, bars = NULL, plot = TRUE)
```

Arguments

`x`	two sample names for analyses of the protolith and altered rock compositions, respectively.
`whichelems`	list of elements to be plotted.
`immobile`	list of (one or more) elements considered as immobile.
`bars`	optional name of the variable containing 1σ errors for plotting error bars.
`plot`	logical, should be the diagram plotted or just the results calculated?

Details

The Concentration ratio diagram shows concentration ratio of each geochemical species of interest (element or oxide) in the 'altered rock' to that in its presumed 'protolith'. These ratios are plotted on the y-axis, and the elements are arranged in any convenient order along x.

Following an open-system geological process, any of the perfectly immobile constituents i should ideally have exactly the same concentration ratio r_{inv} defined as *(Ague 2003)*:

$$r_{inv} = \frac{c_i^A}{c_i^0}$$

where c_i is the concentration of the species i, 0 refers to the 'protolith' and A to the 'altered rock'.

This ratio, however, would only exceptionally equate unity, when the mass of the whole system is conserved. Using the presumably immobile species i as the geochemical reference frame, the change in the rock mass can be defined as *Ague (1994)*:

$$\Delta_{Mass} = \frac{c_i^0}{c_i^A} - 1$$

Thus $r_{inv} > 1$ indicates overall rock mass loss due to removal of mobile constituents; this has the effect of increasing the concentrations of the immobile species ("residual enrichment"). Conversely, $r_{inv} < 1$ shows an overall rock mass gain ("residual dilution").

The mass change of any mobile constituent j can be expressed as *(Ague 1994)*:

$$\Delta_j = \frac{1}{r_{inv}} \frac{c_j^A}{c_j^0} - 1$$

Mobile species j that have $\frac{c_j^A}{c_j^0}$ ratios greater than r_{inv} have been added to the system, and those with ratios lower than r_{inv} have been lost.

In the GCDkit's implementation of the Concentration ratio diagrams, firstly the parental and altered rock samples can be chosen interactively from a binary plot $MgO - SiO_2$, if not specified at the function call. Then the user is prompted for the elements/oxides to be plotted.

If not provided as a comma delimited list among the arguments, the presumably immobile elements are to be specified. To facilitate this choice, printed and plotted as barplots are ordered ratios of the elemental concentrations in the 'altered rock' to that in the 'protolith' ($\frac{c_j^A}{c_j^0}$)).

Finally the concentration ratio diagram is plotted. If the parameter `bars` is given, error bars are also shown corresponding to $+/-1\sigma$.

Value

Returns a matrix '`results`' with the following columns:

`Altered/Protolith`
: concentration ratios of the given geochemical species in the 'altered rock' to that in the 'protolith' - primary y axis of the plot

`Gain/loss in %`
: relative gains (positive) or losses (negative) corrected for the rock mass change - secondary y axis of the plot

```

---

appendSingle *Append empty label or variable*

Description

Appends an empty numeric data column or a new label to the current data set.

Usage

```
appendSingle()
```

Value

Returns the corrected version of the data frame 'labels' or numeric matrix 'WR'.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

`apSaturation` *Apatite saturation*

Description

Calculates apatite saturation temperatures for observed whole-rock major-element compositions. Prints also phosphorus saturation levels for the given major- element compositions and assumed magma temperature.

Usage

```
apSaturation(Si = WR[, "SiO2"], ACNK = WR[, "A/CNK"],
P2O5 = WR[, "P2O5"], T = 0)
```

Arguments

`Si`	SiO_2 contents in the melt (wt. %)
`ACNK`	vector with A/CNK (mol %) values
`P2O5`	vector with P_2O_5 concentrations
`T`	assumed magma temperature in C

Details

* Calculates phosphorus saturation levels following *Harrison & Watson (1984)*:

$$ln(D_P) = \frac{8400 + 26400(SiO_2 - 0.5)}{T} - 3.1 - 12.4(SiO_2 - 0.5)$$

$$P_2O_5.HW = \frac{42}{D_P}$$

where '`T`' = absolute temperature (K), 'D_P' = distribution coefficient for phosphorus between apatite and melt and 'SiO_2' is the weight fraction of silica in the melt, SiO_2 wt. %/100.

These formulae were shown to be valid only for metaluminous rocks, i.e. A/CNK < 1, and were modified for peraluminous rocks (A/CNK > 1) by *Bea et al. (1992):*

$$P_2O_5.Bea = P_2O_5.HW e^{\frac{6429(A/CNK-1)}{(T-273.15)}}$$

and *Pichavant et al. (1992):*

$$P_2O_5.PV = P_2O_5.HW + (A/CNK - 1)e^{\frac{-5900}{T} - 3.22SiO_2 + 9.31}$$

Note that the phosphorus saturation concentrations are not returned by the function but printed only.

* Calculates saturation temperatures in C using the observed P_2O_5 concentrations *(Harrison & Watson, 1984)*:

$$T.HW = \frac{8400 + 26400(SiO_2 - 0.5)}{ln(\frac{42}{P_2O_5}) + 3.1 + 12.4(SiO_2 - 0.5)} - 273.15$$

for peraluminous rocks (A/CNK > 1) the equation of *Bea et al. (1992)* needs to be solved for 'T' (in K) by iterations:

$$P_2O_5.Bea = \frac{42}{e^{\frac{8400+26400(SiO_2-0.5)}{T}-3.1-12.4(SiO_2-0.5)}} e^{\frac{6429(A/CNK-1)}{(T-273.15)}}$$

as is that of *Pichavant et al. (1992)*:

$$P_2O_5.PV = \frac{42}{e^{\frac{8400+26400(SiO_2-0.5)}{T}-3.1-12.4(SiO_2-0.5)}} + (A/CNK-1)e^{\frac{-5900}{T}-3.22SiO_2+9.31}$$

Value

Returns a matrix 'results' with the following columns:

`A/CNK` A/CNK values

`Tap.sat.C.H+W`
saturation T of *Harrison & Watson (1984)* in C

`Tap.sat.C.Bea`
saturation T of *Bea et al. (1992)* in C, peraluminous rocks only

`Tap.sat.C.Pich`
saturation T of *Pichavant et al. (1992)* in C, peraluminous rocks only

Plugin

assign1col *Uniform colours*

Description

Assigns the same plotting colour to all samples.

Usage

```
assign1col(col=-1)
```

Arguments

col	numeric; code of the colour.

Details

This function sets the same colour to all of the plotting symbols. If 'col' = -1 (the default), the user is prompted to specify its code.

Value

Sets 'labels$Colour' to code of the selected plotting colour.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

To display the current legend use showLegend. Symbols and colours by a single label can be assigned by assignSymbLab and assignColLab respectively, symbols and colours by groups simultaneously by assignSymbGroup. Uniform symbols are obtained by assign1symb. Table of available plotting symbols is displayed by showSymbols and colours by showColours.

assign1symb *Uniform symbols*

Description

Assigns the same plotting symbol to all samples.

Usage

```
assign1symb(pch=-1)
```

Arguments

pch	numeric; code of the plotting symbol.

Details

This function sets the same plotting symbol to all the data points. If 'pch' = -1 (the default), the user is prompted to specify its code.

Value

Sets 'labels$Symbol' to code of the selected plotting symbol.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

To display the current legend use showLegend. Symbols and colours by a single label can be assigned by assignSymbLab and assignColLab respectively, symbols and colours by groups simultaneously by assignSymbGroup. Uniform colours are obtained by assign1col. Table of available plotting symbols is displayed by showSymbols and colours by showColours.

---

assignColLab *Colours by label*

Description

Assigns plotting colours according to the levels of the chosen label.

Usage

```
assignColLab()
```

Arguments

None.

Details

The label is selected using the function 'selectColumnLabel'.

Value

Sets 'leg.col' to a sequence number of column in 'labels' that is to be used to build the legend; 'labels$Colour' contains the codes of desired plotting colours.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

To display the current legend use showLegend. Symbols by a single label can be assigned by assignSymbLab, symbols and colours by groups simultaneously by assignSymbGroup. Uniform colours and symbols are obtained by assign1symb and assign1col. Table of available plotting symbols is displayed by showSymbols and colours by showColours.

Selecting a label: selectColumnLabel.

---

assignColVar *Colours by a variable*

Description

Assigns plotting colours according to the values of the variable.

Usage

```
assignColVar(what=NULL,pal="heat.colours",save=TRUE)
```

Arguments

what	variable name or a formula; if NULL a dialogue is displayed
pal	palette
save	should the newly picked colours be assigned to 'labels'?

Details

For selection of the variable is employed the function 'selectColumnLabel'. The user can specify either existing data column in the 'WR' or a formula. The colours can be optionally (default behaviour) assigned globally, so that all the plots will use these from this point on. If not specified upon function call, the palette is picked using '.selectPalette'. The possible values are: 'grays','reds','blues','greens','cyans','violets', 'yellows','cm.colors','heat.c 'terrain.colors','topo.colors' and 'rainbow'. The analyses with no data available for the colours assignment will remain black.

Value

A list of two components, col and leg. The former are the plotting colours, the latter information to build a legend. If save = TRUE, 'labels$Colour' will acquire the codes of desired plotting colours.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

Symbols by a single colour can be assigned by assignColLab, symbols and colours by groups simultaneously by assignSymbGroup. Uniform colours are obtained by assign1col. Table of available plotting colours is obtained by showColours.

Examples

```
assignColVar("Na2O/K2O","greens")
plotDiagram("PeceTaylor",F,F)
```

---

assignSymbGroup *Symbols/colours by groups*

Description

Lets the user to assign plotting symbols and colours according to the levels of the defined groups.

Usage

```
assignSymbLab()
```

Arguments

None.

Value

Sets 'leg.col' and 'leg.pch' to zero, 'labels$Symbol' contains the codes of desired plotting symbols, 'labels$Colour' of plotting colours.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

To display the current legend use showLegend. Symbols by a single label can be assigned by assignSymbLab, colours using assignColLab. Uniform colours and symbols are obtained by assign1symb and assign1col. Table of available plotting symbols is displayed by showSymbols and colours by showColours.

---

assignSymbLab *Symbols by label*

Description

Assigns plotting symbols according to the levels of the chosen label.

Usage

```
assignSymbLab()
```

Arguments

None.

Details

The label is selected using the function 'selectColumnLabel'.

Value

Sets 'leg.pch' to a sequence number of column in 'labels' that is to be used to build the legend; 'labels$Symbol' contains the codes for desired plotting symbols.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

To display the current legend use showLegend. Colours by a single label can be assigned by assignColLab, symbols and colours by groups simultaneously by assignSymbGroup. Uniform colours and symbols are obtained by assign1symb and assign1col. Table of available plotting symbols is displayed by showSymbols and colours by showColours.

Selecting a label: selectColumnLabel.

---

assignSymbLett *Symbols by label - initial letters*

Description

Assigns plotting symbols according to the levels of the chosen label.

Usage

```
assignSymbLett()
```

Arguments

None.

Details

The label is selected using the function 'selectColumnLabel'.

Value

Sets 'leg.pch' to a sequence number of column in 'labels' that is to be used to build the legend; 'labels$Symbol' contains the plotting symbols, which correspond to initial letters for the levels of the specified label.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

To display the current legend use `showLegend`. Symbols by a single label can be assigned by `assignSymbLab`, colours by `assignColLab`, symbols and colours by groups simultaneously by `assignSymbGroup`. Uniform colours or symbols are achieved by `assign1symb` and `assign1col`. Table of available plotting symbols is displayed by `showSymbols` and colours by `showColours`.

`Batchelor` *Batchelor and Bowden (1985)*

Description

Plots data stored in '`WR`' (or its subset) into Batchelor and Bowden's $R_1 - R_2$ diagram.

Usage

```
Batchelor(ideal=TRUE)
```

Arguments

`ideal`	logical, plot ideal minerals composition?

Details

Diagram in $R_1 - R_2$ space, proposed by *De la Roche et al. (1980)*, with fields defined by *Batchelor & Bowden (1985)* as characteristic for following geotectonic environments:

Mantle Fractionates

Pre-plate Collision

Post-collision Uplift

Late-orogenic

Anorogenic

Syn-collision

Post-orogenic

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	R1 = 4 * Si - 11 * (Na + K) - 2 * (Fe[total as bivalent] + Ti), all in millications; as calculated by the function '`LaRoche`'
`y.data`	R2 = 6 * Ca + 2 * Mg + Al, all in millications; as calculated by the function '`LaRoche`'

```

`binary` *Binary plot*

Description

These functions display data as a binary plot.

Usage

```
binary(x=NULL,y=NULL,log="",samples=rownames(WR),
    new=TRUE, ...)

plotWithLimits(x.data, y.data,
    digits.x=NULL, digits.y=NULL,log = "",new = TRUE,
    xmin=.round.min.down(x.data,dec.places=digits.x,expand=TRUE),
    xmax=.round.max.up(x.data,dec.places=digits.x,expand=TRUE),
    ymin=.round.min.down(y.data,dec.places=digits.y,expand=TRUE),
    ymax=.round.max.up(y.data,dec.places=digits.y,expand=TRUE),
    xlab = "", ylab = "", fousy = "",
    IDlabels=getOption("gcd.ident"), fit = FALSE, main = "",
    pch = labels[names(x.data), "Symbol"],
    col = labels[names(x.data), "Colour"],
    cex=labels[names(x.data),"Size"],title=NULL)
```

Arguments

`x,y`	character; specification of the plotting variables (formulae OK).
`log`	a vector `''`, `'x'`, `'y'` or `'xy'` specifying which of the axes are to be logarithmic
`samples`	character or numeric vector; specification of the samples to be plotted.
`new`	logical; should be opened a new plotting window?
`...`	Further parameters to the function '`plotWithLimits`'.
`x.data`	a numerical vector with the x data.

y.data	a numerical vector with the y data.
digits.x	Precision to which should be rounded the x axis labels.
digits.y	Precision to which should be rounded the y axis labels.
xmin, xmax	limits of the x axis.
ymin, ymax	limits of the y axis.
xlab, ylab	labels for the x and y axes, respectively.
fousy	numeric vector: if specified, vertical error bars are plotted at each data point.
IDlabels	labels that are to be used to identify the individual data points
fit	logical, should be the data fitted by a least squares line?
main	main title for the plot.
pch	plotting symbols.
col	plotting colours.
cex	relative size of the plotting symbols.
title	title for the plotting window.

Details

The function 'plots.with.limits' sets up the axes, labels them, plots the data and, if desired, enables the user to identify the data points interactively.

'binary' is the user interface to 'plotWithLimits'.

The variables to be plotted are selected using the function 'selectColumnLabel'. In the specification of the variables can be used also arithmetic expressions, see calcCore for the correct syntax.

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSubset for details.

The functions are Figaro-compatible.

Value

None.

Author(s)

```

```
plotWithLimits(WR[,"SiO2"],WR[,"Rb"],fousy=WR[,"Rb"]*0.05,xlab="SiO2",
ylab="Rb",fit=TRUE)
```

`binaryBoxplot` *Binary boxplot*

Description

A binary plot combined with boxplots for both variables.

Usage

```
binaryBoxplot(xaxis="",yaxis="")
```

Arguments

`xaxis, yaxis` specification of the variables. Formulae are OK.

Details

Unless specified in the call, the variables to be plotted are selected using the function '`selectColumnLabel`.

In the specification of the variables can be used also arithmetic expressions, see `calcCore` for the correct syntax.

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSubset` for details.

The function is not Figaro-compatible.

Value

None.

```

`Boolean conditions` *Select subset by Boolean condition*

Description

Selecting subsets of the current dataset using Boolean conditions that can query both numeric fields and labels. Regular expressions can be employed to search the labels.

Details

The menu item '`Select subset by Boolean`', connected to the function `selectSubset`, enables the user to query by any combination of the numeric columns and labels in the whole dataset. The current data will be replaced by its newly chosen subset.

First, the user is prompted to enter a search pattern which can contain conditions that may employ most of the comparison operators common in R, i.e. < (lower than), > (greater than), <= (lower or equal to), >= (greater or equal to), = or == (equal to), != (not equal to). The character strings should be quoted. The conditions can be combined together by logical `and, or` and brackets.

Logical `and` can be expressed as `.and. .AND. &`

Logical `or` can be expressed as `.or. .OR. |`

Please note that at the moment no extra spaces can be handled (apart from in quoted character strings).

Value

Overwrites the data frame '`labels`' and numeric matrix '`WR`' by subset that fulfills the search criteria.

## Not run:
# Valid search patterns

Intrusion="Rum"
# Finds all analyses from Rum

Intrusion="Rum".and.SiO2>65
Intrusion="Rum".AND.SiO2>65
Intrusion="Rum"&SiO2>65
# All analyses from Rum with silica greater than 65
# (all three expressions are equivalent)

MgO>10&(Locality="Skye"|Locality="Islay")
```

```
# All analyses from Skye or Islay with MgO greater than 10

MgO>=10&(Locality!="Skye"&Locality!="Islay")
# All analyses from any locality except Skye and Islay with MgO greater
# or equal to 10

Locality="^S"
# All analyses from any locality whose name starts with capital S

## End(Not run)
```

`bpplot2` *Box-Percentile Plot*

Description

Displays statistical distribution each of the variables in a data frame using a box-percentile plot *(Esty & Banfield 2003)*.

Usage

```
bpplot2(x,main="Box-Percentile Plot",sub="",xlab = "",
ylab="",log="y",col="lightgray",horizontal=FALSE,ylim = NULL,axes=TRUE,...)
```

Arguments

`x`	data frame with the data to be plotted
`main`	main title for the plot
`sub`	sub title for the plot
`xlab`	label for x axis
`ylab`	label for y axis
`log`	which of the axes is to be logarithmic?
`col`	colour to fill the boxes
`horizontal`	logical, should be the orientation horizontal?
`ylim`	optional; limits for the y axis
`axes`	logical; should be the axis drawn?
`...`	additional plotting parameters

Details

The box-percentile plot is analogous to a `boxplot` but the width of the box is variable, mimicking the distribution of the given variable. As in boxplots, the median and two quartiles are marked by horizontal lines.

Value

None.

Warning

This function IS NOT Figaro-compatible. It means that the set of diagrams cannot be further edited in GCDkit (e.g. tools in "Plot editing" menu are inactive).

Author(s)

The code represents a modified function 'bpplot' from the package 'Hmisc' by Frank E Harrell Jr. (originally designed by Jeffrey Banfield). Adopted for GCDkit by Vojtech Janousek, <vojtech.janousek@geology.cz>.

---

calc *Calculate a new variable*

Description

Calculates a single numeric variable and appends it to the data.

Usage

```
calc()
```

Details

The formula can invoke any combination of names of existing numerical columns, with the constants, brackets, arithmetic operators +−⋆/^ and R functions. See calcCore for a correct syntax.

If the result is a vector of the length corresponding to the number of the samples in the system, the user is prompted for the name of the new data column. Unless a column with the specified name already exists or the given name is empty, the newly calculated column is appended to the data in memory ('WR').

Value

results	numerical vector with the results

Modifies, if appropriate, the numeric matrix 'WR'.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

selectColumnLabel.

Examples

```
## Not run:
# examples of valid formulae....
(Na2O+K2O)/CaO
Rb^2
log10(Sr)
mean(SiO2)/10

# ... but this command is in fact a simple R shell -
# meaning lots of fun for power users!
summary(Rb,na.rm=T)
cbind(SiO2/2,TiO2,Na2O+K2O)
cbind(major)
hist(SiO2,col="red")
boxplot(Rb~factor(groups))

# possibilities are endless
plot(Rb,Sr,col="blue",pch="+",xlab="Rb (ppm)",ylab="Sr (ppm)",log="xy")

## End(Not run)
```

---

calcCore *Calculation of user-defined parameters*

Description

Calculates a user-defined parameter specified by the equation.

Usage

```
calcCore(equation, where = "WR", redo = TRUE)
```

Arguments

equation	a text string to be evaluated.
where	which matrix should be used?
redo	logical; should be the routine called again and again?

Details

This is a core calculation function.

The expression specified by 'equation' can involve any combination of names of existing numerical columns in the matrix 'where', numbers (i.e. constants), arithmetic operators +−∗/^ and R functions.

The most useful of the latter are 'sqrt' (square root), 'log' (natural logarithm), 'log10' (common logarithm), 'exp' (exponential function), 'sin', 'cos' and 'tan' (trigonometric functions).

Potentially useful can be also min (minimum), max (maximum), length (number of elements/cases), 'sum' (sum of the elements), 'mean' (mean of the elements), and 'prod' (product of the elements).

However, any user-defined function can be also invoked here.

For most statistical functions, an useful parameter 'na.rm=T' can be specified. This makes the function to calculate the result from the available data only, ignoring the not determined value (see Examples).

The quotation marks in 'equation' need to preceded by a backslash. Option 'redo' specifies whether the routine should be called repeatedly until some meaningful result is obtained. Otherwise 'NA' is returned.

Value

A list of three items:

equation	equation as entered by the user
results	numeric vector with the results or NA if none can be calculated
formula	the unevaluated expression corresponding to the 'equation'

,

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
calcCore("SiO2/10")

calcCore("Na2O+K2O")

calcCore("log10(Na2O+K2O)")

calcCore("SiO2/MW[\"SiO2\"]")
# dividing by the built-in molecularWeight, NB the backslashes

calcCore("length(MgO)")

calcCore("mean(MgO,na.rm=TRUE)")
# na.rm is a safety measure in case some missing values are present
# otherwise the result would be 'NA'
```

Catanorm *Niggli's Molecular Norm (Catanorm)*

Description

Calculates the Niggli's Molecular Norm (Catanorm) using the algorithm given by *Hutchison (1974)*.

Usage

```
Catanorm(WR,precision=getOption("gcd.digits"))
```

Arguments

WR	a numerical matrix; the whole-rock data to be normalized.
precision	precision of the result.

Details

Normative minerals of the Catanorm

Parameter	Full name	Formula
Q	Quartz	SiO_2
C	Corundum	$AlO_{1.5}$
Or	Orthoclase	$KO_{0.5}.AlO_{1.5}.3SiO_2$
Plag	Plagioclase	$Ab_x.An_{100-x}$

Ap	Apatite	$9CaO.6PO_{2.5}.CaF_2$
	or with no F	$5CaO.3PO_{2.5}$
Fr	Fluorite	CaF_2
Pr	Pyrite	FeS_2
Cf	Calcite	$CaO.CO_2$

Value

A numeric matrix '`results`'.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

References

Hutchison C S (1974) Laboratory Handbook of Petrographic Techniques. John Wiley & Sons, New York, p. 1-527

`CIPW` *CIPW norm*

Description

Calculates various modifications of the CIPW norm.

Usage

```
CIPW(WR, precision = getOption("gcd.digits"), normsum =
FALSE, cancrinite = FALSE, spinel = FALSE)

CIPWhb(WR, precision = getOption("gcd.digits"), normsum = FALSE,
cancrinite = FALSE, spinel = FALSE)
```

Arguments

`WR`	a numerical matrix; the whole-rock data to be normalized.
`precision`	precision of the result.
`normsum`	logical; shall be the normative minerals recast to 100 %?
`cancrinite`	logical; is cancrinite present/to be calculated?
`spinel`	logical; is spinel to be calculated (for ultrabasic rocks, i.e. for samples with SiO_2 < 45 % only)?

Details

The method adopted for 'classic' CIPW norm calculation is that of *Hutchison (1974, 1975)*. The function '`CIPWHB`' is its modification with biotite and hornblende *(Hutchison 1975)*.

Normative minerals of the standard CIPW norm

Parameter	Full name	Formula	Molecular weight
Q	Quartz	SiO_2	60.08
C	Corundum	Al_2O_3	101.96

`classify` *Generic Classification Algorithm*

Description

Classifies rocks using specified diagram.

Usage

```
classify(diagram = "NULL", grp = TRUE, labs = FALSE,
source.sheet = TRUE, overlap = FALSE, X = x.data,
Y = y.data, silent = FALSE, clas=sheet$d$t, ...)
```

Arguments

`diagram`	name of diagram to be used, see details for more info
`grp`	logical: if TRUE, results are assigned to the variable 'groups'
`labs`	logical: if TRUE, yes/no dialogue for results assignment into the matrix 'labels' appears
`source.sheet`	logical: if TRUE, the sheet for `diagram` is newly assigned
`overlap`	logical: if TRUE, possible overlap between polygons of diagram is expected, and duplicate positive result for one sample is treated as polygon intersection
`X`	vector of values for abscissa
`Y`	vector of values for ordinate
`silent`	logical: if TRUE, informative outputs are reduced to minimum
`clas`	classification template to be used
`...`	any additional graphical parameters

Details

Function looks for the name of the polygon within the classification diagram, into which falls the rock analysis represented by the coordinates `[x.data,y.data]`.

In some cases (TAS diagram, Winchester & Floyd's diagram) additional computations are performed. The argument '`diagram`' may acquire one of following values:

```
'AFM', 'PeceTaylor', 'Shand', 'TAS', 'CoxPlut', 'CoxVolc',

'Jensen', 'LarochePlut', 'LarocheVolc', 'WinFloyd1',

'WinFloyd2','TASMiddlemostPlut', 'TASMiddlemostVolc',

'DebonPQ', 'DebonBA', 'MiddlemostPlut', 'QAPFPlut',

'QAPFVolc', 'OConnorPlut', 'QAPFVolc','OConnorVolc',

'Miyashiro', 'Hastie', 'Pearce1996', 'Villaseca', 'NaAlK'.
```

The function is based on the sp package.

Value

Vector of resulting rock names is stored in a variable 'results'. If 'grp = TRUE' results are also assigned to the 'groups' and 'grouping' is set to -1 (as if called from the menu 'Data handling'). If rock projection falls on the boundary between two or more fields, rock names in question are merged together with comment 'boundary between ...'.

Author(s)

The sp package was written by Edzer Pebesma, Roger Bivand and others.

Vojtech Erban, <vojtech.erban@geology.cz>

cluster *Statistics: Hierarchical clustering*

Description

Hierarchical cluster analysis on a set of dissimilarities.

Usage

```
cluster(elems = "SiO2,TiO2,Al2O3,FeOt,MnO,MgO,CaO,Na2O,K2O",
    method = "average")
```

Arguments

elems	numerical columns to be used for cluster analysis, typically major elements
method	the agglomeration method to be employed. This should be one of (or an unambiguous abbreviation thereof): 'ward', 'single', 'complete', 'average', 'mcquitty', 'median', 'centroid'.

Details

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSamples for details.

Even though a list of major elements is assumed as a default, different variables can be specified by the function 'selectColumnsLabels'.

The user is also asked to specify a label for the individual samples, default are their names.

After the dendrogram is drawn, the individual clusters can be identified. For each sample falling into the given group, specified information (e.g. Locality, Rock Type and/or Author) can be printed.

For further details on the clustering algorithm, see the R manual entry of 'hclust'.

Value

None.

Warning

Names of existing numeric data columns and not formulae involving these can be handled at this stage. Only complete cases are used for the cluster analysis.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

'hclust'

---

contourGroups *Outline individual groups in a binary plot*

Description

The functions outline the individual clusters of data (groups by default) on a binary plot. Implemented methods are the convex hull or contours. This can be useful for a quick appreciation of the data distribution, e.g. in classification diagrams.

Usage

```
contourGroups(clusters=groups,border=NULL,fill=FALSE,precision=50, ...)

chullGroups(clusters=groups,border=NULL,fill=FALSE,...)
```

Arguments

clusters	grouping information for each of the samples.
border	outline colours.
fill	logical; should be the polygons filled by the border colour?
precision	a number indicating how tight the contours should be.
...	additional parameters to the functions contour and polygon, respectively.

Details

If not specified, the colours are selected as the most frequently occurring one defined among samples within each group.

For the function *contourGroups*, the shape of the contours drawn can be controlled using the parameter *(precision)*. The higher it is, the smoother contours result.

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

plotDiagram("PeceTaylor",FALSE,FALSE)
contourGroups()
```

---

coplotByGroup *Coplot by groups*

Description

Plots a series of binary plots, for each of the groups separately.

Usage

```
coplotByGroup(xaxis = "",yaxis = "",show.leg = "")
```

Arguments

xaxis	Name of the data column to be used as x axis.
yaxis	Name of the data column to be used as y axis.
show.leg	Logical: are the levels of the conditioning variable ('groups') to be shown?

Details

For examination of large datasets split into user-defined subsets serves in R function coplot. It produces a set of binary diagrams with the data filtered out according to the values of the third (conditioning) variable. In case of the function 'coplotByGroup' it is done by groups.

If no parameters 'xlab', 'ylab' and 'show.leg' are given, the user is prompted to specify them.

The variables to be plotted are selected using the function 'selectColumnLabel.

See manual entry for 'coplot' for further details.

Value

None.

Warning

Please note that no formulae can be handled at this stage.

This function IS NOT Figaro-compatible.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz> & Vojtech Erban, <vojtech.erban@geology.cz>

See Also

'coplot'

Examples

```
coplotByGroup("SiO2","Na2O",show.leg=TRUE)
```

---

coplotTri *Coplot for three variables*

Description

Plots a series of binary plots split into several groups according to the values of the third, so called conditioning, variable.

Usage

```
coplotTri(xaxis = "", yaxis = "", zaxis = "", int = "")
```

Arguments

xaxis	Name of the data column to be used as x axis.
yaxis	Name of the data column to be used as y axis.
zaxis	Name of the data column with the conditioning variable.
int	The specification of the intervals: either 'auto' or a list of break points separated by commas.

Details

For examination of large datasets split into user-defined subsets serves in R the function 'coplot'. It displays a series of binary diagrams with the data filtered out according to the values of the third (conditioning) variable.

If no parameters 'xlab', 'ylab' and 'zlab' are given, the user is prompted to specify them.

The variables to be plotted are selected using the function 'selectColumnLabel.

After this is done, the user is prompted to enter a comma-delimited list of at least one break point defining the intervals. The default includes the mean, that will be automatically supplemented by minimum and maximum (i.e. two intervals).

See manual entry for 'coplot' for further details.

Value

None.

Warning

Please note that no formulae can be handled at this stage.

This function IS NOT Figaro-compatible.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz> & Vojtech Erban, <vojtech.erban@geology.cz>

'coplot'

Examples

```
coplotTri("SiO2","Na2O","MgO","auto")

coplotTri("MgO","Na2O","SiO2","50,60")
# the intervals of the conditioning variable, SiO2,
# will be (min(SiO2) - 50),(50 - 60) and (60 - max(SiO2))
```

---

correlationCoefPlot

Statistics: Correlation coefficient patterns

Description

Produces, for each group a separate, set of plots of correlation coefficient patterns.

Usage

```
correlationCoefPlot(elems = "K,Rb,Ba,Sr,Zr,P,Ti,Y,U,Th")
```

Arguments

elems	list of desired elements

Details

The utility of correlation coefficient patterns was discussed by *Rollinson (1993 and references therein)*. Basically similarity in correlation patterns between two or more elements means their analogous geochemical behaviour, potentially controlled by the same geochemical process (fractional crystallization, partial melting, weathering, hydrothermal alteration...)

The variables are selected using the function 'selectColumnsLabels'.

Value

None.

Cox *TAS diagram (Cox et al. 1979)*

Description

Assigns data for Cox's diagram into Figaro template (list 'sheet') and appropriate values into 'x.data' and 'y.data'.

Usage

```
CoxVolc(alkline=TRUE)

CoxPlut(alkline=TRUE)
```

Arguments

alkline	Logical: Should the boundary between alkaline and subalkaline rocks (Irvine & Baragar 1971) be drawn?

Details

TAS diagram, as proposed by *Cox et al. (1979)* for volcanic rocks and adapted by *Wilson (1989)* for plutonic rocks contains following fields:

volcanic rocks	**plutonic rocks**
basalt	*gabbro*
basaltic andesite	*undefined*
andesite	*diorite*
dacite	*quartz diorite (granodiorite)*
rhyolite	*alkali granite/granite*
hawaiite	*gabbro*
trachyandesite	*undefined*
basanite/tephrite	*undefined*
mugearite	*syeno-diorite*
benmorite	*syenite*
trachyte	*syenite*
nephelinite	*ijolite*
phonology nephelinite	*undefined*
phonolitic tephrite	*undefined*
phonolite	*nepheline syenite*

Value

sheet	list with Figaro Style Sheet data
x.data	SiO2 weight percent
y.data	Na2O+K2O weight percent

crosstab *Cross table of labels*

Description

Prints a cross table (contingency table) for 1-3 labels.

Usage

```
crosstab(plot = TRUE)
```

Arguments

plot	logical; should be also a barplot plotted?

Details

This command prints a frequency distribution (for a single label) or a contingency table (for 2-3 labels) useful for inspection of the data structure. Optionally a barplot is plotted (for 1-2 labels).

Just press Enter (enter an empty field), when the desired number of variables is reached.

Value

`results` the frequency/contingency table

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

`customScript` *Add a new variable to a script*

Description

Adds a formula to calculate a single numeric variable to the specified `*.r` file (a R script).

Usage

```
customScript()
```

Details

A formula can be entered that can involve any combination of names of existing numerical columns, with the constants, brackets, arithmetic operators `+-*/^` and R functions. See `calcCore` for a correct syntax.

Then the user is prompted for the name of the variable an any comments that should appear in the file.

The filename is chosen interactively, the default suffix for the R programs is `.r`. If the file exists already, the script is appended to its end.

If desired, the calculated variable can be, after the script is executed, added automatically to the numeric data, i.e. the numeric matrix `WR`. If not, the contents of the calculated variable can be viewed by simply typing its name in the R Console window.

The script can be run at a later time using the R command `File|Source`. Alternatively, it can be placed among the so-called plugins into the subdirectory `Plugin`. All files placed here with a suffix `*.r` are executed each time when the new data file is being loaded into the GCDkit.

Value

None.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

Examples

```
## Not run:
# examples of valid formulae....
(Na2O+K2O)/CaO
Rb^2
log10(Sr)
mean(SiO2)/10

# ... but this command is in fact a simple R shell -
# meaning lots of fun for power users!
summary(Rb,na.rm=T)
cbind(SiO2/2,TiO2,Na2O+K2O)
cbind(major)
hist(SiO2,col="red")
boxplot(Rb~factor(groups))

# possibilities are endless
plot(Rb,Sr,col="blue",pch="+",xlab="Rb (ppm)",ylab="Sr (ppm)",log="xy")

## End(Not run)
```

---

cutMy *Groups by numerical variable*

Description

Grouping the data according to the interval of a single numerical variable it falls into.

Usage

```
cutMy()
```

Arguments

None.

Details

The numeric data column is selected using the function '`selectColumnLabel`'.

After this is done, the user is prompted to enter a comma-delimited list or at least one break point defining the intervals. The default includes the mean, that will be automatically supplemented by minimum and maximum (i.e. two intervals).

Then the names of the individual groups are to be specified; values out of range are automatically labeled as '`Unclassified`'. The vector containing the information on the current groups can be appended to the data frame '`labels`'.

Value

`groups`	character vector: the grouping information
`grouping`	If the new column was appended the data frame `labels`, sequence number of this column; if not appended, though, this variable is set to -100.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

cut

Debon *BA and PQ diagrams (Debon + Le Fort 1983)*

Description

Assigns data for Debon & Le Fort's B-A and P-Q diagrams into Figaro template (list 'sheet') and appropriate values into 'x.data' and 'y.data'.

Usage

```
DebonBA()
DebonPQ()
```

Details

The B-A diagram as proposed by *Debon and Le Fort (1983)* defines six sectors (I - VI), reflecting alumina balance of samples. Following minerals are characteristic for individual sectors:

I	Peraluminous domain	*muscovite > biotite*
II		*biotite > muscovite*
III		*biotite (+- minor amphibole)*
IV	Metaluminous domain	*biotite, amphibole, +- pyroxene*
V		*clinopyroxene, +- amphibole, +-biotite*
VI		*unusual mineral associations (carbonatites ...)*

Layout of the P-Q diagram of the same authors corresponds to cationic proportions of quartz, K-feldspar and plagioclase. Acronyms used as classification output represent following rocks groups:

label	**plutonic rocks**	**volcanic rocks**
go	*gabbro, diorite, anorthosite*	*basalt, andesite, kenningite*
mzgo	*monzogabbro, monzodiorite*	*latibasalt, latiandesite*
mz	*monzonite*	*latite*
s	*syenite*	*trachyte*
dq	*qtz diorite,qtz gabbro,qtz anorthosite*	*qtz andesite,qtz basalt*
mzdq	*qtz monzodiorite,qtz monzogabbro*	*qtz latiandesite,qtz latibasalt*
mzq	*quartz monzonite*	*quartz latite*
sq	*quartz syenite*	*quartz trachyte*
to	*tonalite, trondhjemite*	*dacite*
gd	*granodiorite, granogabbro*	*rhyodacite*
ad	*adamellite*	*dellenite*
gr	*granite*	*rhyolite*

Parameters for the diagram are calculated by the function 'DebonCalc'. All of them are based on

millications (1000 gram-atoms per 100 grams).

P = K - (Na + Ca)

Q = Si / 3 - (K + Na + 2 * Ca / 3)

A = Al - (K + Na + 2 Ca)

B = Fe + Mg + Ti

Note that the diagrams B-A and P-Q are recommended as complementary, i.e. resulting names should be used in conjunction (*granite II* etc.). For details, see *Debon & Le Fort (1983)* or *(1988)*.

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	P or B value. See details.
`y.data`	Q or A value. See details.

`deleteSingle` *Delete label or variable*

Description

Deletes a single numeric variable or a label.

Usage

```
deleteSingle()
```

Details

The variables to be deleted is selected using the function '`selectColumnLabel`'. In any case, a confirmation is required before a variable is deleted from the system. Note that some variables are required by the system and cannot be deleted.

Value

Returns the corrected version of the data frame '`labels`' or numeric matrix '`WR`'.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Edit labels *Edit labels*

Description

Simultaneous editing of all labels using a spreadsheet-like interface.

Usage

```
labels<-editData(x=labels)
```

Arguments

x	data frame/numeric matrix to be edited; default is 'WR'

Details

The function invokes a spreadsheet-like interface that enables the user to edit the labels for individual samples. When all the desired changes have been performed, close button is to be clicked.

Value

Returns the corrected version of the data frame 'labels'.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

'data.entry'

Edit numeric data *Edit numeric data*

Description

Simultaneous editing of all numeric data using a spreadsheet-like interface.

Usage

```
WR<-editData(x = WR)
```

Details

The function invokes a spreadsheet-like interface that enables the user to edit the numeric data for individual samples. When all the desired changes have been performed, close button is to be clicked.

The system then performs some recalculations as if the data set was loaded from the disc afresh (calling 'Gcdkit.r').

Value

Returns the corrected version of the numeric matrix 'WR'.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

'data.entry'

---

editLabFactor *Edit label as factor*

Description

Global replacement each of the discrete values (levels) for a selected label.

Usage

```
editLabFactor()
```

Details

The label to be edited is selected using the function 'selectColumnLabel'.

Then the function invokes a spreadsheet-like interface that enables the user to overwrite directly any of the discrete values for the a given label, in the R jargon called *levels*. When all the desired changes have been performed, close button is to be clicked.

Value

Returns the corrected version of the data frame labels.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

'data.entry'

`elemIso` *Binary plot of a WR geochemical parameter vs isotopic ratio*

Description

Plots a diagram of a selected whole-rock geochemical parameter vs initial Sr isotopic ratios or initial $\epsilon(Nd)$ for selected samples.

Usage

```
elemIso()
```

Arguments

None.

Details

The variable to be plotted as x axis is selected using the function '`selectColumnLabel`'. In the specification of the variable can be used also an arithmetic expression, see `calcCore` for the correct syntax.

The plotted isotopic parameters (y axis) can be one of:

Menu item	**Explanation**
87Sr/86Sri	Initial Sr isotopic ratios
143Nd/144Ndi	Initial Nd isotopic ratios
EpsNdi	Initial $\epsilon(Nd)$ values
1 stg DM model ages *(Goldstein et al. 1988)*	Single-stage DM Nd model ages
1 stg DM model ages *(Liew & Hofmann 1988)*	Single-stage DM Nd model ages
2 stg DM model ages *(Liew & Hofmann 1988)*	Two-stage DM Nd model ages

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

Value

None.

Plugin

SrNd.r

`epsEps` *Binary plot of initial Sr isotopic ratios vs. initial epsilon Nd values*

Description

Plots a diagram of initial Sr isotopic ratios vs. initial $\epsilon(Nd)$ values for selected samples.

Usage

```
epsEps()
```

Arguments

None.

Details

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

Value

None.

Plugin

SrNd.r

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

`Export to Access` *Export to Access*

Description

This function serves for exporting the specified data into MDB (MS Access) format (via the ODBC interface).

Usage

```
accessExport(what=cbind(labels, WR), tablename=NULL,
transpose=FALSE,dec.places=NULL)
```

Arguments

`what`	a matrix, data frame or a list
`tablename`	name of the data table
`transpose`	logical; transpose the data?
`dec.places`	numeric; number of decimal places

Details

The function `accessExport` outputs the specified data via Microsoft's ODBC interface, taking an advantage of the library `'RODBC'`. Unlike for the function '`excelExport`', ODBC makes possible opening a new file.

If the argument `'what'` is a matrix or data frame, the name of the table can be specified using the optional parameter `'tablename'`.

For a list, several tables are created, their number and names corresponding to the items present.

Value

None.

Warning

This function is not available on 64-bit systems!

Author(s)

The RODBC package was written by Brian Ripley.

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

See Also

'`excelExport`' '`dbfExport`'

Examples

```
accessExport(results) # Saves the last calculated results
```

`Export to DBF` *Export to DBF*

Description

This function serves for exporting the specified data into DBF (dBase III) format (using the function '`write.dbf`' of the package '`foreign`').

Usage

```
dbfExport(what=cbind(labels,WR), transpose=FALSE)
```

Arguments

`what`	a matrix or data frame
`transpose`	logical; transpose the data frame?

Details

The function `dbfExport` outputs the specified data. Note that it cannot handle lists.

Value

None.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

See Also

'`write.dbf`''`excelExport`''`accessExport`'

Examples

```
dbfExport(results) # Saves the last calculated results
```

`Export to Excel` *Export to Excel*

Description

This function serves for exporting the specified data into XLS or XLSX (MS Excel) formats (via the ODBC interface).

Usage

```
excelExport(what=cbind(labels, WR), tablename =NULL,
transpose=FALSE, dec.places=NULL)

excel2007Export(what=cbind(labels, WR), tablename =NULL,
transpose=FALSE, dec.places=NULL)
```

Arguments

`what`	a matrix, data frame or a list
`tablename`	name of the data sheet
`transpose`	logical; transpose the data?
`dec.places`	numeric; number of decimal places

Details

The functions `excelExport` and `excel2007Export` output the specified data via Microsoft's ODBC interface, taking an advantage of the library `'RODBC'`.

If the argument `'what'` is a matrix or data frame, the name of the sheet can be specified using the optional parameter `'tablename'`.

For a list, several sheets are attached, their number and names corresponding to the items present.

Value

None.

Warning

These functions are not available on 64-bit systems!

Unfortunately the way the ODBC is programmed by Microsoft does not make opening a new Excel file possible. Thus only adding new sheet(s) to a pre-existing spreadsheet file is feasible.

Author(s)

The RODBC package was written by Brian Ripley.

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

Examples

```
excelExport(results) # Saves the last calculated results in XLS format

excel2007Export(results) # Saves the last calculated results in XLSX (or XLS) format
```

`Export to HTML tables`

Export to HTML tables

Description

Outputs the specified data with (optional) labels into HTML. This format is useful for importing into spreadsheets, word processors or publishing on the WWW.

Usage

```
HTMLTableMain(what,digits=2,desc=NULL,title=" ",sum.up=FALSE,open=TRUE,
close=TRUE,filename=paste(gcdx.dir,"R2HTML/htmltable",sep="/"),rotate=FALSE)

HTMLtableOrdered(what,which=rownames(what),labs=labels,digits=2,desc=NULL,
title=" ",sum.up=FALSE,key1=NULL,key2=NULL,
filename=paste(gcdx.dir,"R2HTML/htmltable",sep="/"),split.by=25,rotate=TRUE)
```

```
HTMLTableWR(filename="htmltable")

HTMLTableResults(filename="htmltable")
```

Arguments

`what`	numeric matrix; data to be exported
`digits`	required precision
`desc`	name of the columns within 'labels' to be attached to the table
`title`	main title
`sum.up`	logical; should be a sum calculated?
`open`	logical; should be opened a new HTML file?
`close`	logical; should be the HTML file closed when finished?
`filename`	optional name for the file produced
`rotate`	logical, should be the table transposed, with samples in columns and variables in rows?
`which`	(optional) sample names in numeric matrix 'what' for the output
`labs`	name of variable with textual labels
`key1`	is a variable in numeric matrix 'what'
`key2`	is a grouping information (name of a column in 'labs')
`split.by`	maximal number of data columns per page

Details

`HTMLTableWR` and `HTMLTableResults` are GUI front ends to `HTMLTableMain`, the former enabling the user to choose samples (rows) and columns for the output using the searching mechanisms common in the GCDkit.

`HTMLTableWR` outputs the numeric data (with optional labels and sum) stored in the data matrix `'WR'`.

`HTMLtableOrdered` also outputs the numeric data stored in the numeric matrix specified by parameter `'what'`. Optional argument `'which'` gives the list of sample names (rows) in the matrix to be saved. The data are first sorted based on `'key2'`, which typically gives a grouping information (name of a column in `'labs'`). Within each of the groups, the data are further sorted based on the numeric variable `'key1'`. See example.

`HTMLTableResults` outputs the results of the most recent calculation (with optional labels and sum) as stored in the variable `'results'`.

The plugin attempts to format sub- and superscripts in the names of variables.

The created file `'filename'` is placed in the subdirectory `'R2HTM'` of the current working directory; when finished, it is previewed in a browser. The style for the table is determined by the cascade style file `R2HTML.css` in the subdirectory `'Plugin'`.

Value

None.

Warning

The plugin uses R2HTML library, which must be downloaded from CRAN and properly installed. Its presence is checked before the code is executed.

Author(s)

The R2HTML package was written by Eric Lecoutre.

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
# Works on the 'sazava' test data set
setwd(paste(gcdx.dir,"Test_data",sep="/"))
loadData("sazava.data")

HTMLTableMain(WR[,c("SiO2","MgO","FeOt")],digits=2,desc="Intrusion",title="Sazava data [w

HTMLtableOrdered(WR[,LILE],digits=1,key1="SiO2",key2="Intrusion",title="Large Ion Lithoph
```

FeMiddlemost *Adjustment of Fe oxidation ratio (Middlemost 1989))*

Description

Auxiliary function performing adjustment of the iron-oxidation ratio as proposed by *Middlemost (1989)*.

Usage

```
FeMiddlemost(anhydrous = TRUE)
```

Arguments

anhydrous	logical; should be returned major-element analyses recast to anhydrous basis?

Details

This function performs an adjustment of the iron-oxidation ratio for individual volcanic rock types as proposed by *Middlemost (1989)*.

The classification is based on TAS classification (*Le Bas et al. 1986*, *Le Maitre et al. 1989*).

The Fe_2O_3/FeO ratios for individual rock types, based on *Verma et al. (2002)* (Fig. 1), are as follows:

foidite, $Na_2O + K_2O$ <= 3	0.15
foidite, 3 < $Na_2O + K_2O$ <= 7	0.2
foidite, 7 < $Na_2O + K_2O$ <= 10	0.3
foidite, $Na_2O + K_2O$ > 10	0.4
picrobasalt	0.15
basalt	0.2
basaltic andesite	0.3
andesite	0.35
dacite	0.4
rhyolite	0.5
trachybasalt	0.3
basaltic trachyandesite	0.35
trachyandesite	0.4

trachyte/trachydacite	0.5
tephrite/basanite, $Na_2O + K_2O$ <= 6	0.2
tephrite/basanite, $Na_2O + K_2O$ > 6	0.3
phonotephrite	0.35
tephriphonolite	0.4
phonolite	0.5

If the parameter 'anhydrous' is set, returned are the major-element data recast to 100 % anhydrous basis.

Value

A matrix with adjusted whole-rock chemical data.
No permanent changes to either 'WR' or 'WRanh' are made.

---

figAdd *Plot editing: Add*

Description

These functions enable adding new components to Figaro-compatible plots.

Usage

```
figTicks(major=-0.5,minor=0.25,xmjr=NULL,xmin=NULL,ymjr=NULL,ymin=NULL)

figGrid(lty="dotted", col="gray30")

figLegend()

figAddReservoirs(autoscale=FALSE,reservoirs=NULL,labs=NULL)

figAddText()

figAddArrow()

figAddBox()

figAddFit()

figAddCurve()
```

Arguments

major	length of the major tick marks
minor	length of the minor tick marks
xmjr, ymjr	intervals for the major tick marks
xmin, ymin	intervals for the minor tick marks
lty	grid line type
col	plotting colour
autoscale	logical; should be the scaling changed so that all the overplotted values are shown?
reservoirs	text; regular expression specifying reservoirs compositions of which are to be plotted
labs	text; optional abbreviated labels for the individual reservoirs

Details

'figTicks' adds major and minor tick marks for the x and y axes. Their length is specified as a fraction of the height of a line of text. Negative numbers imply outward and positive inward pointing ticks. The user is prompted for four numbers separated by commas, xmjr, xmin, ymjr, ymin. These specify the intervals of major and minor ticks for x and y axes, respectively. Not implemented to logarithmic plots and spiderplots yet.

'figGrid' adds grid lines for x and/or y axes.

'figLegend' adds legend(s) on specified location.

'figAddReservoirs' overplots compositions of selected geochemical reservoirs (from the file 'reservoirs.data', see selectNorm for the file structure as well as relevant references) and/or ideal minerals (from the file 'idealmins.data'). The optional parameter reservoirs enables use in batch mode (see Examples). Please note that this function is available so far for binary plots and spiderplots only.

'figAddText' adds text on specified location. The parameters are the text style ('n' = normal, 'b' = bold, 'i' = italic and 'bi' = bold italic), colour and relative size.

'figAddArrow' adds arrow on specified location. The parameters are colour and line style ('solid', 'dashed', 'dotted' and 'dotdash').

'figAddBox' adds box on specified location (click bottom left and then top right corner).

'figAddFit' adds either a single least-squares fit to all data, or several fit lines, for each of the groups separately. The parameters are colour and line style ('solid', 'dashed', 'dotted' and 'dotdash'). The equation of each fit line is plotted at the user-defined location.

'figAddCurve' adds a curve, specified as a function of variable 'x'. The parameters are colour and line style ('solid', 'dashed', 'dotted' and 'dotdash').

'figAddCurve' adds a curve, specified as a function of variable 'x'. The parameters are colour and line style ('solid', 'dashed', 'dotted' and 'dotdash').

The colours can be specified both by their code (see table under menu 'Data handling|Show available colours') or R name (see Examples).

The additional two menu items, available for binary and ternary plots, allow adding contours or convex hulls outlining individual groups of data. See contourGroups and chullGroups.

Warning

These functions serve to adding some extra components/annotations immediately before the graph is printed/exported. Note that all user-defined components added via 'Plot editing: Add' will be lost upon redrawing, zooming ....

# Sun & McDonough mantle reservoirs, Taylor & McLennan 1995 Upper and Lower Crust
reserv.names<-c("NMORB","EMORB","OIB","UCC","LCC")
figAddReservoirs(TRUE,reserv,reserv.names)
```

---

figaro.identify *Plot editing: Identification of plotted symbols*

Description

These functions allow the user to identify points in Figaro-compatible plots.

Usage

```
figIdentify()

highlightSelection()
```

Details

'figIdentify' identifies points closest to a mouse pointer, if a mouse button is pressed. For binary and ternary plots, sample names are plotted; for spider plots the function prints the sample name, concentration of the given element (in ppm) and highlights the whole pattern. The identification is terminated by pressing the right button and selecting 'Stop' from the menu.

'highlightSelection' allows the selected analyses to be highlighted. The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSubset for details.

If the search results are empty or embrace all samples, the user is given a chance to select the samples from the list of their names. Press Ctrl+click to select multiple ones.

For binary and ternary plots, Press Esc in the Console window to stop the points blinking. In spider plots are shown overall ranges of normalized concentrations (by a gray field) with superimposed patterns for selected samples.

figCol *Plot editing: Colours*

Description

These functions enable altering colours for titles or all plotting symbols in Figaro-compatible plots.

Usage

```
figCol(col=NULL)

figColMain(col=NULL)

figColSub(col=NULL)

figBw()
```

Arguments

col	colour specification

Details

The colours can be specified both by their code (see table under *Data handling|Show available colours*) or R name (see Examples).

`figBw` sets the whole plot (main title and subtitle, axes and plotting symbols) in black and white, making them ready for printing/exporting.

figColMain(col="red")
figColSub(col="blue")
```

---

figEdit *Plot editing: Changing titles and axis labels*

Description

These functions enable altering titles and axis labels of binary (`figXlab, figYlab`) and ternary (`figAlab, figBlab, figClab`), Figaro-compatible plots.

Usage

```
figMain(txt=NULL)

figSub(txt=NULL)

figXlab(txt=NULL)

figYlab(txt=NULL)

figAlab(txt=NULL)
```

```
figBlab(txt=NULL)

figClab(txt=NULL)
```

Arguments

txt	text

Details

If specified, the parameter txt will be passed to the function 'annotate' to guess the correct reformatting to sub- and superscripts for production of "publication quality" plots. Otherwise, the current value (titles or labels for axes/apices) are edited.

Author(s)

Colin M. Farrow, <c.farrow@compserv.gla.ac.uk>

and Vojtech Janousek, <vojtech.janousek@geology.cz>

figYlab(txt="Total alkalis")
```

---

figGbo *Defining groups on Figaro-compatible plots*

Description

Interactive definition of groups on any Figaro-compatible plot.

Usage

```
figGbo(x.tol = 0, y.tol = 0, max.points = 100, max.polygons = 25)
```

Arguments

x.tol, y.tol	tolerance for the automatic closing of polygons.
max.points	maximum number of vertices for a single polygon.
max.polygons	maximum number of polygons.

Details

Each of the groups is defined by clicking vertices of a polygon with the corresponding data points. The polygons are closed automatically. To finish, right click anywhere on the plot and select 'Stop'. The groups are numbered consecutively, points falling into two or more fields form extra groups, as do unclassified samples.

'figaro'

---

figLoad *Loading a Figaro plot*

Description

Loads a Figaro-compatible plot (both the template and the data) stored in a file.

Usage

```
figLoad()
```

Arguments

None.

Details

The default suffix for the saved diagrams is 'fgr'. Note that only the data needed for the plotting ('x.data', 'y.data') are stored in the 'fgr' files. Thus the data set currently in memory (e.g., variables 'WR', 'labels', ...) is unaffected by the function 'figLoad'.

figSave figaro

figMulti *Figaro: Multiple plot by groups*

Description

Displays multiple plots, for each of the groups one, based on a most recently plotted Figaro-compatible template. For spiderplots, the colour field denotes the total variation with the whole dataset.

Usage

```
figMulti(x=x.data,y=y.data,nrow=NULL,ncol=NULL,xlab=sheet$demo$call$xlab,
ylab=sheet$demo$call$ylab,pch=NULL,col=NULL,
cex = NULL,plot.symb=NULL,shaded.col="gray",rotate.xlab=TRUE,
offset=TRUE,centered=FALSE,...)
```

Arguments

x, y	data to be plotted
nrow, ncol	dimensions of the plots' matrix
xlab, ylab	labels for the axes
pch	plotting symbols
col	plotting colours
cex	relative size of the plotting symbols
plot.symb	logical, spiders. Shall be shown also plotting symbols or just lines?
shaded.col	(spiders) Colour for the field portraying the overall variability in the dataset.
rotate.xlab	logical, spiders. Shall be the element names on x axis rotated?
offset	logical, spiders. Shall be the names for odd and even elements shifted relative to each other?
centered	logical, spiders. Shall be the element names on x axis plotted in between tick marks?
...	any additional graphical parameters

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See Plate, Plate editing and figaro for details.

figMulti(plot.symb=TRUE,cex=2)

figMulti(col="red",plot.symb=FALSE,rotate.xlab=FALSE,offset=TRUE)

figMulti(col="red",plot.symb=FALSE,rotate.xlab=FALSE,offset=FALSE,shaded.col="khaki")
```

---

figRedraw *Redrawing/refreshing a Figaro plot*

Description

This function redraws/refreshes a Figaro-compatible plot.

Usage

```
figRedraw(x=x.data,y=y.data,zoom=NULL,bw=FALSE)

refreshFig()
```

Arguments

x	vector of x coordinates
y	vector of y coordinates
zoom	logical; redraw while zooming?
bw	logical; should be the output black and white?

Warning

Note that all user-defined components added via 'Plot editing: Add' (legend, lines, text, boxes, ...) - will be lost.

figCexSub(0.5)
```

---

figUser *Plot editing: User defined parameter*

Description

Enables the power users to modify the plot parameters directly.

Usage

```
figUser(expression=NULL)
```

Arguments

expression	character; expression to be evaluated

Details

The parameters can be specified at the function call. If not, they are chosen by a dialogue. Several of the, can entered simultaneously, as a semicolon delimited list. The most useful might be:

main	Main title
sub	Sub title
xlab	Label of x axis
ylab	Label of y axis
xlim	Limits for the x axis
ylim	Limits for the y axis
bg	Colour of background
pch	Plotting symbols
col	Colour of plotting symbols

cex	Relative size of plotting symbols
log	Which of the axes is logarithmic? (`""`,`"x"`,`"y"` or `"xy"`)

If no parameters are entered, they can be chosen from a list (still experimental!)

Menu

Plot editing: User defined parameter

Warning

If requesting a logarithmic plot, make sure that the axis ranges are positive. See Examples or invoke menu items '`Plot editing: Scale x axis`' and '`Plot editing: Scale y axis`'.

Author(s)

figUser("main=\"My plot\"; las=2; font.main=4; cex.main=2; col.main=\"blue\"")
```

`figZoom` *Plot editing: Zooming*

Description

These functions zoom in and out Figaro-compatible plots.

Usage

```
figZoom()

figUnzoom()

figXlim(range=NULL)

figYlim(range=NULL)
```

Arguments

range	numeric: two limits, minimum and maximum, for the given axis.

Details

'figZoom' zooms the specified rectangular area (click bottom left and then top right corner) in a new window. The zoomed area is highlighted in the old window.

'figUnzoom' closes the new window with blown up portion of the plotting window and returns to the original window.

'figXlim' and 'figYlim' allow to change the plotting limits (as a list of two components, separated by commas).

Warning

If requesting a logarithmic plot, make sure that the axis ranges are positive.

## End(Not run)
```

`filledContourFig` *Filled contours plot*

Description

Generates a frequency plot on the basis of the most recently plotted Figaro template.

Usage

```
filledContourFig(xlab=sheet$demo$call$xlab,ylab=sheet$demo$call$ylab,
xlim=sheet$demo$call$xlim,ylim=sheet$demo$call$ylim,
annotate.fields=FALSE,...)
```

Arguments

`xlab`	character vector; label for the x axis
`ylab`	character vector; label for the y axis
`xlim`	limits for the x axis
`ylim`	limits for the y axis
`annotate.fields`	logical; should be the plotted fields labeled by their names?
`...`	additional plotting parameters

Details

This is a somewhat modified version of the R function '`filled.contour`' that produces a frequency plot on the basis of a Figaro template and superimposes, if desired, selected data points.

First the user is prompted, how many intervals should be each of the axes split into. This corresponds to a density of grid, in which are the individual points classified into. Then a colour scheme (palette) can be chosen. Lastly, after the frequency plot is generated, selected analyses can be plotted ('overplot'). In the latter case, standard GCDkit routine is used to selectSamples.

Value

None.

'`addContours`''`selectSubset`''`figaro`'

`Frost` *Frost et al. (2001)*

Description

Classification of granitic rocks proposed by Frost et al (2001).

Usage

```
Frost(plot.txt = getOption("gcd.plot.text"),
clssf = FALSE, GUI = FALSE)
```

Arguments

`plot.txt`	logical, annotate fields by their names?
`clssf`	logical, should the samples be classified?
`GUI`	logical, is the function called from a GUI?

Details

Classification scheme proposed by *Frost et al. (2001)*. It consists of three diagrams:

- * $Fe\ number$ vs. SiO_2
  Note, that the Fe-number is calculated as weight proportion of $FeO/(FeO + MgO)$ (or $FeO_{tot}/(FeO_{tot} + MgO)$), see below). The approach used here should not be confused with the more common usage of the term "Fe-number" (as well as "Mg-number") as molecular proportions.
- * $Na_2O + K_2O - CaO$ vs. SiO_2 (in wt. %).
- * A/NK vs. ASI, where A/NK stands for molecular $Al_2O_3/(Na_2O + K_2O)$, and ASI for molecular $Al_2O_3/(Na_2O + K_2O + CaO - 1.67P_2O_5)$. In fact, it is the A/CNK parameter of *Shand (1943)*, corrected for the Ca content in apatite. As approved by one of the authors *(C. Barnes, pers. comm., 2008)*, the equation for ASI in the original work *(Frost et al. 2001)* was stated erroneously in molecular proportions of elements, instead of oxides. In fact, this diagram was not plotted in the paper, but it replaces the conditions mentioned in the text and is in our view more instructive.

The classification is designed to work both with analyses distinguishing between ferrous and ferric iron (preferred) and those with total iron only. The dialogue box lets the user decide, whether to use the ferrous iron value or the total iron.

Similarly, if some P_2O_5 concentration are missing in the dataset, the user is prompted whether the missing values should be replaced with zero. If not, the problematic analyses are not plotted/classified.

Value

The function returns table of calculated coefficients (Fe-Number, MALI, ASI). There are two values for the ASI: one labeled `'ASI'` is calculated from molecular proportions of oxides, and is used for plotting and classification. The other one is labeled `'ASI_orig'`, and is calculated exactly as stated in the original paper (i.e. $Al/(Ca - 1.67P + Na + K)$.

The following associations are distinguished:

ferroan

magnesian

alkalic

alkali-calcic

calc-alkalic

calcic

peralkaline

metaluminous

peraluminous

The geologically reasonable combinations, together with examples, are listed in the `../Diagrams/Geotectonic/FrostTable.htm`, modified from the original article.

Note

Due to the specific design of this classification (combination of multiple diagrams), the classification option is not available via the pull-down menus. Currently, the only way to apply Frost's classification in GCDkit on individual samples is to call the function manually from the Console (`Frost(clssf = TRUE)`).

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

gcdOptions *GCDkit options*

Description

A graphical user interface (GUI, programmed in Tcl/Tk) for setting the main options controlling the behaviour of the GCDkit.

Usage

```
gcdOptions()
```

Arguments

None.

Details

The settings are stored permanently in the file 'gcdkit.xxx' residing in the main GCDkit directory. They are loaded upon start up. If is missing or damaged, this file is created anew based on the default values.

The panel connected to the function 'gcdOptions' serves to change several parameters. Most of them are passed to a list accessible in a way similar to the standard R options. See the corresponding manual page for details and Examples for their implementation. Only a few are stored in dedicated variables (see below).

First, the default working directory can be set (and stored in the global variable data.dir).

The parameter 'Minimize output on screen?' is linked to the option gcd.shut.up. It controls excessive output to the Console window. Its default value is FALSE, meaning that detailed information is to be printed. This, however, may become not viable on slower systems and/or for extensive data sets.

The preferred precision of the numeric values that need to be rounded off are controlled by the parameter 'Precision of results' (option gcd.digits).

Using the parameter 'Plotting symbols magnification', linked to the option gcd.cex, one can define a factor, by which are multiplied the plotting sizes defined for individual analyses upon startup and stored in the variable 'labels[,"Size"]'. Please note that this is effective for the next plot if the GUI frontend is used to set this parameter, otherwise it will work for data files loaded from now on.

In this way, the magnification is maintained proportional to the original sizes. If uniform plotting symbols sizes are desired, one should use the function setCex invoked from the menu Plot settings|Set uniform symbol size.

The parameter 'Annotate fields in discrimination plots?' toggles the labeling of the fields on and off, typically for classification or geotectonic diagrams. It is stored in a logical variable gcd.plot.text, whose default is TRUE. The language for the field annotations can be selected using the list box connected to the option gcd.language.

The next possibility is to alter the colours used, e.g, for texts or field boundaries on diagrams. There are in total three colours stored in the list plt.col. Alternatively, all the plots can be set to black and white (check box 'Set to BW?' linked to the option 'gcd.plot.bw'), excluding the data points. The default is FALSE (i.e. colour plotting).

The parameter 'Identify points?' toggles on and off the identification/labelling of individual data points on plots. In general, the identification can be either interactive (option gcd.ident.each = TRUE) or all the points can be labeled automatically as soon as the plotting is finished (option gcd.ident.each = FALSE). In the former case, the user may click the left mouse button near the points to be identified, pressing the right mouse button when finished.

The option gcd.ident determines whether identification should take place at all (the default value is zero, which means no identification). If the identification is on, the option gcd.ident attains either 1 (identification by sample name), or the sequential number of the column in the data frame 'labels' increased by one (identification by a label).

The identification by sample name for a current plot can be invoked also from the menu 'Plot editing|Identify points'. There can be also chosen alternative means of points identification ('Plot editing|Highlight multiple points').

Value

Sets the following options:

gcd.plot.text
: logical; should be fields on classification diagrams labeled by their names?

gcd.language
: language for these labels.

gcd.plot.bw
: logical; if TRUE, plots are produced as black and white.

gcd.shut.up
: logical; determines whether extensive textual output is to be printed.

gcd.ident
: numeric; if zero, no identification takes place after plotting each diagram. If greater than zero, indicates the variable used to identify individual data points. See Details.

gcd.ident.each
: logical; are the data points to be identified individually?

gcd.digits
: preferred number of digits for rounding off the numeric values.

gcd.cex
: a factor by which are multiplied all symbol sizes previously defined.

Remaining options changed by GCDkit which cannot be altered via the GUI, though:

prompt
: "GCDkit-> "

windowsBuffered
: FALSE

locatorBell
: FALSE

scipen
: 20

max.print
: 99999999

If necessary they can be set directly in the file 'gcdkit.xxx'.

Apart from that the GUI panel sets the variables data.dir (default data directory) and plt.col (colours for Figaro-compatible plots).

```

---

graphicsOff *Close all graphic windows*

Description

Closes all graphic windows.

Usage

```
graphicsOff()
```

Arguments

None.

Details

Under Windows 95/98/ME, the R system may become install, failing to redraw graphical windows if too many of them are being open. It is always a good idea to close the unnecessary ones, for instance using this function.

See Also

'dev.off'

`groupsByCluster` *Groups by cluster analysis*

Description

Grouping the data using the cluster analysis.

Usage

```
groupsByCluster(elems=
"SiO2,TiO2,Al2O3,FeOt,MnO,MgO,CaO,Na2O,K2O",
method="ave")
```

Arguments

`elems`	numerical columns to be used for cluster analysis, typically major elements
`method`	the agglomeration method to be employed. This should be one of (or an unambiguous abbreviation thereof): `'ward', 'single', 'complete', 'average', 'mcquitty', 'median', 'centroid'`.

Details

After the dendrogram is drawn, the user is asked how many clusters is the dataset to be broken into.

The vector containing the information on the current groups can be appended to the data frame '`labels`'.

The groups are initially numbered but this can be changed readily using the function `editLabFactor`.

For further details on the clustering algorithm, see the R manual entry of '`hclust`'.

Value

`groups`	character vector: the grouping information
`grouping`	set to zero.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

See Also

classify groupsByLabel groupsByDiagram

groupsByDiagram *Groups by diagram*

Description

Grouping the data on a basis of selected classification diagram.

Usage

```
groupsByDiagram(silent = TRUE)
```

Arguments

silent	logical; should be echoed the information about classification each of the samples?

Value

groups	character vector: the grouping information
grouping	set to -1.

Author(s)

Vojtech Erban, <vojtech.erban@geology.cz>

See Also

classify groupsByLabel groupsByCluster

groupsByLabel *Groups by label*

Description

Grouping the data according to the levels of a single label.

Usage

```
groupsByLabel(lab=NULL)
```

Arguments

lab	name or sequence number of the label

Details

Sets the groups on the selected column within the data frame 'labels'. If not specified at the function call, the appropriate label is selected by the function 'selectColumnLabel'.

Value

`groups`	character vector: the grouping information
`grouping`	the sequence number of the column in the data frame '`labels`' used for grouping

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

```

Harris *Harris et al. (1986) Hf-Rb/30-Ta*3*

Description

Assigns data for the Hf-Rb/30-Ta*3 ternary diagram of *Harris et al. (1986)* into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
Harris()
```

Details

Triangular diagram with apices Hf, Rb/30 and Ta*3, proposed by *Harris et al. (1986)* for classification of collisional granites.

Following fields are defined:

VA	*Volcanic-Arc granites (Group 1, VA)*
WP	*Within-Plate granites (Group 4, WP)*
Group 2	
Group 3	

Quoting from their abstract:

(i) Group 1 - *Pre-collision calc-alkaline (volcanic-arc) intrusions* which are mostly derived from mantle modified by a subduction component and which are characterized by selective enrichments in LIL elements.

(ii) Group 2 - *Syn-collision peraluminous intrusions (leucogranies)* which may be derived from the hydrated bases of continental thrust sheets and which are characterized by high Rb/Zr and Ta/Nb and low K/Rb ratios.

(iii) Group 3 - *Late or post-collision calc-alkaline intrusions* which may be derived from a mantle source but undergo extensive crustal contamination and can only be distinguished from volcanic-arc intrusions by their higher ratios of Ta/Hf and Ta/Zr.

(iv) Group 4 - *Post-collision alkaline intrusions* which may be derived from mantle lithosphere beneath the collision zones and which carry high concentrations of both LIL and HFS elements.

Value

`sheet` list with Figaro Style Sheet data

`x.data, y.data`
Th, Hf/3 and Ta in ppm recalculated into two dimensions

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

```
#plot the diagram
plotDiagram("Harris", FALSE)
```

Hastie *Co-Th diagram (Hastie et al. 2007)*

Description

Assigns data for Co vs. Th (ppm) diagram into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'

Usage

```
Hastie()
```

Details

Diagram in Co vs. Th space, proposed by *Hastie et al. (2007)* for subdivision of volcanic arc rocks. This is thought to be a more robust replacement for SiO_2 vs. K_2O plot of *Peccerillo & Taylor (1976)* for altered/weathered volcanic rocks. The decreasing Co concentrations are used as an index of fractionation (as a proxy for SiO_2), the Th contents mimic those of K_2O.

The following fields are defined:

Tholeiite Series
Calc-alkaline Series
High-K Calc-alkaline and Shoshonite Series

Rocks with composition falling beyond defined boundaries are labeled *'undefined'* by the 'classify' function.

In addition, the diagram discriminates between the following rock types:

Abbreviation	Full name
B	basalt
BA/A	basaltic andesite and andesite
D/R*	dacite and rhyolite*

* latites and trachytes also fall in the D/R fields

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	Co ppm
`y.data`	Th ppm

```

ID *Sample identification*

Description

Identification/labelling of individual data points on plots.

Usage

```
ID(x, y, labs = getOption("gcd.ident"), offset = 0.4,
col = "gray30", cex = 1)
```

Arguments

x, y	vector with x-y coordinates of the data points
labs	text to label individual data points, see details
offset	distance (in char widths) between label and identified points.
col	colour of the text
cex	its size

Details

In GCDkit, the option 'ident' determines whether the user wishes to identify data points on binary and ternary plots. The default is zero, which means no identification.

If 'ident' differs from zero, internal function 'ID' can be invoked. Its parameter labs is either a single number, or character vector.

In the former case, the variable 'labs' contains either 1 (identification by sample name), or the sequential number of the column in the data frame 'labels' increased by one (identification by a user- defined label).

Alternatively, a character vector labs can be used to specify the text directly.

Value

None.

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

identify gcdOptions options

Examples

```
getOption("ident")        # yields the current value of the given option
```

info *Info on datafile*

Description

Prints information about the current dataset (and its selected subset, if applicable).

Usage

```
info()
```

Details

This function prints comprehensive information about the current dataset. For each of the labels, individual levels and their frequencies are given. The number of numeric columns is printed, and for each of the variables number of available values. Moreover, the information concerning the total number of samples, the names of the samples in the selected subset (or all samples if none is defined) and the current grouping are shown.

Value

None

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

isochron *Rb-Sr and Sm-Nd isochrons*

Description

Plots a Rb-Sr or Sm-Nd isochron diagram and calculates a simple linear fit to the selected data.

Usage

```
isochron()
```

Arguments

None.

Details

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

If empty list is given, all the samples for which the required isotopic data are available are plotted and the user can choose their subset interactively. Then the isochron diagram is redrawn only with those samples.

The data are fitted by simple least-squares linear fit, from which the age and initial ratio are calculated.

Value

Returns a numeric vector with the calculated age and initial ratio.

Plugin

SrNd.r

`isocon` *Isocon plots (Grant 1986)*

Description

Implementation of isocon plot after *Grant (1986, 2005)* widely used for quantitative estimates of changes in mass/volume/concentration of elements or oxides in course of various open-system geochemical processes such as alteration or partial melting.

Usage

```
isocon(x = NULL, whichelems = NULL, immobile = NULL, atomic = FALSE, plot = TRUE

isoconAtoms()

isoconOxides()
```

Arguments

`x`	numeric matrix with the chemical data
`whichelems`	list of elements for plotting, separated by commas
`immobile`	list of presumed immobile elements, separated by commas
`atomic`	logical; should be atomic wt. % used for oxides?
`plot`	logical; is the graphical output desirable?

Details

Isocon plot *(Grant 1986, 2005)* spans from the theoretical quantitative treatment of losses or gains of geochemical species (elements or oxides). It is applicable to balancing mass, volume and/or concentration changes in course of open-system processes such as weathering, hydrothermal alteration, metasomatic addition/leaching or migmatitization.

According to *Grant (2005 and references therein)* the equation for composition/volume changes in open-system process can be written as:

$$c_i^A = \frac{M^0}{M^A}(c_i^0 + \Delta c_i)$$

where c_i is the concentration of the species i, 0 refers to the original rock and A to the altered rock, M^0 is the equivalent mass before and M^A after alteration.

For immobile element ($\Delta c_i = 0$) the ratio $\frac{M^0}{M^A}$ reflecting the overall change in mass can be obtained. This can be done graphically in the plot of the analytical data for presumed protolith (c_i^0) and altered rock (c_i^A). Such a straight line passing through the origin is termed isocon, the equation of which is:

$$c^A = (\frac{M^0}{M^A})c^0$$

Species plotting above the isocon were gained, whereas those plotting below were lost, and the gain or loss is according to *Grant (2005)*:

$$\frac{\Delta c_i}{c_i^0} = \frac{M^A}{M^0}\frac{c_i^A}{c_i^0} - 1$$

where $\frac{c_i^A}{c_i^0}$ is the slope of the tie line from the origin to the data point.

In the GCDkit's implementation of the function `'isocon'`, firstly the parental and altered rock samples are to be chosen interactively from a binary plot $MgO - SiO_2$. Then the user is prompted for the elements/oxides to be used in the isocon analysis. Printed and plotted in the form of barplots are ordered slopes for each data point in the isocon diagram.

The user can choose the presumably immobile elements. These can be either provided as a comma delimited list, or, if empty, chosen interactively from the isocon plot. Finally are plotted two isocons, as well as a blue equiline (a straight line with the slope 1).

Implemented are two methods for assessing the change in mass of the system. Traditionally used has been the slope of the isocon line, obtained by linear regression of the presumably immobile data (dark green). However, this depends on the scaling of the isocon plot, which is arbitrary. In particular, the data plotted close to the origin may appear erroneously to lie on an isocon *(Baumgartner & Olsen, 1995)*.

More objectively, the change in the mass can be estimated by clustering slopes to data points, deciphering the elements/oxides with a similar behaviour and averaging the slopes for the selected presumably immobile species.

Functions *'isoconAtoms'* and *'isoconOxides'* are frontends to the function `'isocon'`, providing different default values. See Arguments above.

Value

Returns a list `'results'` with the following components:

`slope.avg`	slope of the isocon obtained as an average of the slopes for the individual presumably 'immobile' species
`slope.regression`	slope obtained by linear regression
`balance`	numeric matrix; balance of individual species. This matrix contains the following columns:
`XXX=orig.`	composition of the parental (unaltered) rock
`XXX=alt.`	composition of the altered rock
`Slope data point`	slope of the line connecting the data point with origin

`G/L rel.(LQ)` relative mass gain/loss, isocon slope by least-squares fit

`G/L rel.(avg)`
relative mass gain/loss, averaged slopes for immobile elements

`G/L wt%/ppm(LQ)`
absolute mass gain/loss, isocon slope by least-squares fit

`G/L wt%/ppm(avg)`
absolute mass gain/loss, averaged slopes for immobile elements

`Jensen` *Jensen cation plot (1976)*

Description

Assigns data for Jensen's cation plot into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
Jensen()
```

Details

Jensen's cation plot, proposed by *Jensen (1976)* and modified by *Jensen & Pyke (1982)*. The triangular diagram is defined on the basis of millications as follows:

left apex: Al

upper apex: $Fe^T + Ti$

right apex: Mg

The diagram defines following rock series and names:

Komatiite series (KOMATIITE)	*Komatiite*
	Komatiitic basalt
Tholeiite series (TH)	*Rhyolite*
	Dacite
	Andesite
	High-Fe tholeiite basalt
	High-Mg tholeiite basalt
Calc-alkaline series (CA)	*Rhyolite*
	Dacite
	Andesite
	Basalt

Value

`x.data, y.data`
: Values for the three apices transformed into 2D space

`sheet`
: list with Figaro Style Sheet data

`joinGroups` *Merge groups*

Description

Enables merging several groups into a single one.

Usage

```
joinGroups()
```

Arguments

None.

Details

This function is the most useful to merge several groups, defined e.g. on the basis of a classification plot. A simple spreadsheet is invoked with two columns, the first (`'Old'`) containing the old levels of groups and the second, `'New'`, which can be edited. Finally, groups with identical names will be merged into a single one.

Optionally, the vector containing the information on the current groups can be appended to the data frame '`labels`'.

Value

`groups`	character vector: the grouping information
`grouping`	Sequential number of the column with grouping information in `labels` (if appended) or simply set to -100.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

`Jung` *Al/Ti thermometer for granitic rocks (Jung + Pfander 2007)*

Description

This function estimates the temperature of a granitic magma based on measured Al_2O_3/TiO_2 ratio and experimental constraints. The regression formulae were defined by *Jung & Pfander (2007)*.

Usage

```
Jung(model = NULL, plot = TRUE)
```

Arguments

`model`	specification of the model
`plot`	logical; should be shown a Al_2O_3/TiO_2 vs. CaO/Na_2O plot?

Details

As shown by *Sylvester (1998)*, the Al_2O_3/TiO_2 ratio in the granitic magmas is temperature sensitive, decreasing with the increasing temperature of the crustal anatexis. This probably reflects an increasing instability of Ti-bearing phases with progressive crustal fusion.

Jung & Pfander (2007) compiled the available experimental data and defined a set of regression formulae (linear, power law and exponential) for several types of protoliths.

Any of the following models can be chosen: pelite melting, psammite melting, igneous rock melting, A-type granite melting, amphibolite melting after *Rapp & Watson (1995)* and amphibolite melting after *Patino Douce & Beard (1995)*.

Optionally, also Al_2O_3/TiO_2 vs. CaO/Na_2O plot could be displayed with three secondary axes annotated by the calculated temperatures.

Value

Returns a matrix '`results`' with the following columns:

`Al2O3/TiO2`	wt. % ratio of Al_2O_3/TiO_2
`T_Al/Ti.power.C`	temperature in C, power law calibration
`T_Al/Ti.exp.C`	temperature in C, exponential calibration
`T_Al/Ti.linear.C`	temperature in C, linear calibration
`T_Al/Ti.mean.C`	mean temperature in C, based on the above three models

Plugin

Jung.r

Erratum

As pointed out by *S. Jung (pers. com. 2009)*, in Table 1 of their original paper were printed wrongly several of the regression coefficients. These are:

Rock	Model	*Jung and Pfander (2007)*	Corrected
A-type	power law	B = 0.992	B = 9.921
amphibolite *(Rapp and Watson 1995)*	power law	A = 2.82x10^3	A = 2.82x10^30

The function implements these corrected values.

Laroche *R1-R2 diagram (De la Roche et al. 1980)*

Description

Assigns data for the $R_1 - R_2$ diagram into Figaro template (list 'sheet') and appropriate values into 'x.data' and 'y.data'.

Usage

```
LarocheVolc()

LarochePlut()
```

Details

$R_1 - R_2$ plot, as proposed by *De La Roche et al. (1980)* for volcanic, as well as plutonic rocks:

volcanic rocks	**plutonic rocks**
trachyphonolite	*nepheline syenite*
phonolite	*nepheline syenite*
phono-tephrite	*essexite*
tephrite	*essexite*
alkali rhyolite	*alkali granite*
qtz.trachyte	*qtz.syenite*
trachyte	*syenite*
rhyolite	*granite*
qtz.latite	*qtz.monzonite*
rhyodacite	*granodiorite*
dacite	*tonalite*
andesite	*diorite*
lati-andesite	*monzodiorite*
latite	*monzonite*
mugearite	*syenodiorite*
nephelinite	*ijolite*
andesi-basalt	*gabbro-diorite*
lati-basalt	*monzogabbro*
hawaiite	*syenogabbro*
tholeiite	*gabbronorite*
basalt	*gabbro*
alkali basalt	*alkaligabbro*
basanite	*theralite*
ankaratrite	*melteigite*
picritic rock	*ultramafic rock*

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	R1 = 4 * Si - 11 * (Na + K) - 2 * (Fe[total as bivalent] + Ti), all in millications; as calculated by the function '`LaRocheCalc()`'
`y.data`	R2 = 6 * Ca + 2 * Mg + Al, all in millications; as calculated by the function '`LaRocheCalc()`'

`loadData` *Loading data into GCDkit*

Description

Loads data from a file (or, alternatively, a clipboard) into GCDkit. The files may contain plain text, or, if library RODBC (has been installed, can be in the dBase III/IV (*.dbf), Excel (*.xls), Access (*.mdb), PetroGraph (*.peg), IgPet or NewPet (*.roc) formats.

Usage

```
loadData(filename=NULL,separators = c("\t", ",", ";"),
na.strings = c("NA","-","bd", "b.d.", "bdl", "b.d.l.", "N.A.","n.d."),
clipboard = FALSE, merging = FALSE);

loadDataOdbc(filename=NULL,na.strings=c("NA","-", "bd",
"b.d.", "bdl", "b.d.l.", "N.A.","n.d."),merging=FALSE,
ODBC.choose=TRUE)
```

Arguments

`filename`	fully qualified name of the file to be loaded, including suffix.
`separators`	strings that should be tested as prospective delimiters separating individual items in the data file.
`na.strings`	strings that will be interpreted, together with empty items, zeros and negative numbers, as missing values (`NA`).
`clipboard`	logical; is clipboard to be read instead of a file?
`merging`	logical; is the function invoked during merging of two data files?
`ODBC.choose`	logical; if TRUE, ODBC channel can be chosen interactively.

Details

If library RODBC is available, the functions attempt to establish an ODBC connection to the selected file, and open it as dBase III/IV (*.dbf), Excel (*.xls) or Access (*.mdb) format. The DBF files are used to store data by other popular geochemical packages, such as IgPet *(Carr, 1995)* or MinPet *(Richard, 1995)*.

Another format that can be imported is *.csv. It is employed by geochemical database systems such as GEOROC (`http://georoc.mpch-mainz.gwdg.de/georoc/`) and PETDB (`http://www.petdb.org/`).

The import filter for the *.csv files has been tailored to keep the structure of these databases in mind.

The package PetroGraph *(Petrelli et al. 2005)* saves data into *.peg files that are also, in principle, *.csv files compatible with the GCDkit.

Data files *.roc are yet another variant of *.csv files, used by NewPet *(Clarke et al. 1994)*. This is not to be confused with the *.roc format designed for IgPet *(Carr, 1995)*. This is a text file with a quite complex structure, whose import is still largely experimental. DBF files are to be preferred for this purpose.

If not successful, the function '`loadData`' assumes that it is dealing with a simple text file.

On the other hand 'loadDataOdbc' allows an ODBC channel to be specified interactively if 'ODBC.choose=TRUE'.

Plain text files can be delimited by tabs, commas or semicolons (the delimiter is recognized automatically). Alternative separators list can be specified by the optional 'separators' parameter. The Windows clipboard is just taken as a special kind of a tab-delimited text file.

In the text file, the first line contains names for the data columns (except for the first one that is automatically assumed to contain the sample names); hence the first line may (or may not) have one item less than the following ones. The data rows start with sample name and do not have to be all of the same length (the rest of the row is filled by 'NA' automatically).

Missing values ('NA') are allowed anywhere in the data file (naturally apart from sample and column names); any of 'NA', 'N.A.', '-', 'b.d.', 'bd', 'b.d.l.','bdl' or 'n.d.' are also treated as such, as specified by the parameter na.strings.

While loading, the values '#WHATEVER!' (Excel error messages) are also replaced by 'NA' automatically.

Please note that the function 'loadDataOdbc', due to the current limitations of the RODBC package, cannot handle correctly columns of mixed numeric and textual data. In such a column all textual information is converted to 'NA' and this unfortunately concerns the sample names as well. If encountering any problems, please use import from text file or via clipboard, which are much more robust.

The negative numbers and values '< x' (used by some authors to indicate items below detection limit) can be either replaced by their half (i.e. half of the detection limit) or 'NA'. User is prompted which of these options he prefers.

Alternatively, the negative values can be viewed either as missing ('NA') or can be imported, as may be desirable for instance for stable isotope data in the delta notation.

Decimal commas, if present in text file, are converted to decimal points.

The data files can be practically freeform, i.e. no specified oxides/elements are required and no exact order of these is to be adhered to. Analyses can contain as many numeric columns as necessary, the names of oxides and trace elements are self-explanatory (e.g. "SiO2", "Fe2O3", "Rb", "Nd".

In the text files (or if pasting from clipboard), any line starting with the hash symbol ('#') is ignored and can be used to introduce comments or to prevent the given analysis from loading temporarily.

Note that names of variables are case sensitive in R. However, any of the fully upper case names of the oxides/elements that appear in the following list are translated automatically to the appropriate capitalization:

SiO2, TiO2, Al2O3, Fe2O3, FeO, MnO, MgO, CaO, Na2O, FeOt, Fe2O3t,

Li2O, mg#, Ac, Ag, Al, As, At, Au, Ba, Be, Bi,

Br, Ca, Cd, Ce, Cl, Co, Cr, Cs, Cu, Dy, Er, Eu,

Fe, Ga, Gd, Ge, Hf, Hg, Ho, In, Ir, La, Li, Lu,

Mg, Mn, Mo, Na, Nb, Nd, Ne, Ni, Np, Os, Pa, Pb,

Pd, Pm, Pr, Pt, Pu, Rb, Re, Rh, Ru, S, Sb, Sc,

Se, Si, Sm, Sn, Sr, Ta, Tb, Te, Th, Ti, Tl, Tm,

Yb, Zn, Zr.

Total iron, if given, should be expressed either as ferrous oxide ('FeOt', 'FeOT', 'FeOtot', 'FeOTOT' or 'FeO*') or ferric oxide ('Fe2O3t', 'Fe2O3T', 'Fe2O3tot', 'Fe2O3TOT' or 'Fe2O3*').

Structurally bound water can be named 'H2O.PLUS', 'H2O+', 'H2OPLUS', 'H2OP' or 'H2O_PLUS'.

Upon loading, all the completely empty columns are removed first. Any non-numeric items found in a data column with one of the names listed in the above dictionary are assumed to be typos and replaced by 'NA', after a warning appears. At the next stage all fully numeric data columns are stored in a numeric data matrix 'WR'.

For any missing major- and minor-element data (SiO2, TiO2, Al2O3, Fe2O3, FeO, MnO, MgO, CaO, Na2O, K2O, H2O.PLUS, CO2, P2O5, F, S), an empty (NA) column is created automatically.

The remaining, that is all at least partly textual data columns are transferred to the data frame 'labels'. To this are also attached a column whose name starts with 'Symbol' (if any) that is taken as containing plotting symbols and a column whose name is 'Colour' or 'Color'(if any, capitalization does not matter) that may contain plotting colours specification. The relative size of the individual plotting symbols may be specified in a column named 'Size' or 'cex' that is also to be attached to the 'labels'.

The plotting symbols can be given either by their code (see showSymbols) or directly as strings of single characters.

The colours can be specified as codes (1-49) or English names (see showColours or type 'colours()' into the Console window).

If specifications of the plotting symbols and colours are missing completely, and at least one non-numeric variable is present, the user is prompted whether he does not want to have the symbols and colours assigned automatically, from 1 to *n*, according to the levels of the selected label. Otherwise default symbols (empty black circles) are used.

The default grouping is set on the basis of plotting symbols '(labels$Symbol)' or the data column used to autoassign the plotting symbols and colours.

Value

WR	numeric matrix: all numeric data
labels	data frame: all at least partly character fields; labels$Symbol contains plotting symbols and labels$Colour the plotting colours

The function prints a short summary about the loaded file. It also loads and executes the Plugins, i.e. all the R code (*.r) that is currently stored in the subdirectory '\Plugin'. Finally, the system performs some recalculations (calling 'Gcdkit.r').

Note

In order to ensure the database functionality, duplicated column (variable) names are not allowed. This concerns, to a large extent, also the sample names. The only exception are CSV files - if duplicated samples are found, sequence numbers are assigned instead.

All completely empty rows and columns in both labels and numeric data are ignored.

Author(s)

The RODBC package was written by Brian Ripley.

`Maniar` *Maniar and Piccoli (1989)*

Description

Plots data stored in 'WR' (or its subset) into Maniar and Piccoli's series of diagrams.

Usage

```
Maniar(plot.txt = getOption("gcd.plot.text"))
```

Arguments

`plot.txt`	logical, annotate fields by their names?

Details

Collection of six binary diagrams, based on major elements chemistry, developed by *Maniar & Piccoli (1989)* for tectonic discrimination of granitic rocks. *Shand's (1943)* diagram is also used. Diagrams are defined as follows:

x axis	y axis
SiO_2	K_2O
SiO_2	Al_2O_3
SiO_2	$\frac{FeO(T)}{(FeO(T)+MgO)}$
$\frac{100*MgO}{(Al_2O_3+Na_2O+K_2O+FeO(T)+MgO)}$ M and F proportion in the AFM system	$\frac{100*FeO(T)}{(Al_2O_3+Na_2O+K_2O+FeO(T)+MgO)}$

$\frac{100*CaO}{(Al_2O_3+Na_2O+K_2O+FeO(T)+MgO+CaO)}$ C and F proportion in the ACF system

$\frac{100*(FeO(T)+MgO)}{(Al_2O_3+Na_2O+K_2O+FeO(T)+MgO+CaO)}$ A/NK (molar)

A/CNK (molar)

Abbreviations used in diagrams represent granitoids from following geotectonic environments:

IAG	*Island Arc Granitoids*
CAG	*Continental Arc Granitoids*
CCG	*Continental Collision Granitoids*
POG	*Post-orogenic Granitoids*
RRG	*Rift-related Granitoids*
CEUG	*Continental Epeirogenic Uplift Granitoids*
OP	*Oceanic Plagiogranites*

Peralkaline, Metaluminous and Peraluminous rocks are defined in the last (Shand's) diagram.

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

mergeData *Appending data to a current data set*

Description

These functions append new data to the analyses currently stored in the memory of the GCDkit.

Usage

```
mergeDataRows()
mergeDataCols(all.rows=NULL)
```

Arguments

all.rows	logical; should be all samples preserved, even those missing in one of the datasets ?

Details

The function 'mergeDataRows' appends new samples (i.e. new rows). The structures of both datafiles are, as much as possible, matched against each other, and, if necessary, new empty columns are introduced to the original data file, if they are missing. If any duplicated sample names are found, they are replaced by sequence numbers and a new column 'old.ID' is appended to the labels. Also appended is a column named 'file' containing the name of the file the particular sample originated from.

'mergeDataCols' adds new data (i.e. new data columns) to the samples stored in the memory. If desired ('all.rows' is 'TRUE'), included are also samples that occur solely in one of the files.

For the guidelines on correct formatting of the data files see loadData.

Value

WR	numeric matrix: all numeric data
labels	data frame: all at least partly character fields; labels$Symbol contains plotting symbols and labels$Colour the plotting colours

The function prints a short summary about the loaded file.

`Meschede` *Meschede (1986) Zr/4-2Nb-Y*

Description

Assigns data for a *Meschede's (1986)* triangular diagram into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
Meschede()
```

Details

Triangular diagram with apices Zr/4, 2Nb and Y, proposed by *Meschede (1986)*. The plot serves primarily for tectonic discrimination of tholeiitic basalts.

Abbreviations used in diagram represent following geotectonic settings:

AI-AII	*Within-Plate Alkaline Basalts*
AII-C	*Within-Plate Tholeiites*
B	*P-type Mid-Ocean Ridge Basalts*
D	*N-type Mid-Ocean Ridge Basalts*
C-D	*Volcanic Arc Basalts*

Value

`sheet` list with Figaro Style Sheet data

`x.data, y.data`
Zr/4, 2Nb and Y values recalculated into two dimensions

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

`Mesonorm` *Improved Mesonorm for granitoid rocks*

Description

Calculates *eine bessere* Mesonorm for granitoids of *Mielke & Winkler (1979)*.

Usage

```
Mesonorm(WR, precision = getOption("gcd.digits"))

Streckeisen(x)
```

Arguments

`WR`	a numerical matrix; the whole-rock data to be normalized.
`precision`	precision of the result.
`x`	Normative minerals calculated by the function `Mesonorm`.

Details

This method of norm calculation should yield mineral proportions close to the actual mode of granitoid rocks. The calculated minerals are:

```
Orthoclase, Albite, Anorthite, Quartz, Apatite, Magnetite,
Hematite, Ilmenite, Biotite, Amphibole, Calcite, Corundum,
Rest
```

If desired, the function plots Q'-ANOR diagram of Streckeisen & Le Maitre (1979) using the function `Streckeisen`. The fields in this diagram are labeled as follows:

2	alkali feldspar granite
3	granite
4	granodiorite
5	tonalite
6*	quartz alkali feldspar syenite
7*	quartz syenite
8*	quartz monzonite
9*	quartz monzodiorite/quartz monzogabbro
10*	quartz diorite/quartz gabbro
6	alkali feldspar syenite
7	syenite
8	monzonite
9	monzodiorite/monzogabbro
10	diorite/gabbro

Value

A numeric matrix '`results`'.

Middlemost *Middlemost's diagram (1985)*

Description

Assigns data for Middlemost's diagram into Figaro template (list 'sheet') and appropriate values into 'x.data' and 'y.data'.

Usage

```
MiddlemostPlut()
```

Details

Classification diagram, as proposed by *Middlemost (1985)* for magmatic rocks.

Value

sheet	list with Figaro Style Sheet data
x.data	SiO2 weight percent
y.data	Na2O+K2O weight percent
results	matrix with classification results
groups	vector with classification results
grouping	set to -1

Author(s)

classify("MiddlemostPlut")

#To plot data stored in WR or its subset (menu Classification)
plotDiagram("MiddlemostPlut", FALSE)
```

`millications` *Millications*

Description

Returns millications.

Usage

```
millications(print=FALSE)
```

Arguments

`print`	logical: print the result?

Details

The millications are used for many plots of the French school, e.g. *De la Roche et al. (1980)* or *Debon & Le Fort (1983, 1988)*. The calculated values are `Si, Ti, Al, Fe3, Fe2, Fe, Mn, Mg, Ca, Na, K, P`.

$$Element_i = 1000 \frac{Oxide_i(wt.\%)}{MW(Oxide_i))} * x(Element_i)$$

Where: MW = molecularWeight of the Oxide[i], x = number of atoms of Element[i] in its formula

Value

Numeric matrix '`results`' with the millications

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

`Misc` *Miscellaneous geochemical indexes*

Description

Calculates a series of useful geochemical indexes.

Usage

```
Misc(WR)
```

Arguments

`WR`	a numerical matrix; the whole-rock data to be recalculated.

Details

Various petrochemical indexes are calculated, such as:

- total iron as Fe_2O_3
- Fe_2O_3/FeO, Na_2O/K_2O and K_2O/Na_2O ratios
- Larsen's DI - Differentiation index *(Larsen 1938)*
- Kuno's SI - Solidification index *(Kuno 1959)*
- Agpaitic index *(Ussing 1912)*

Value

A numeric matrix '`results`'.

`Miyashiro` *SiO2-FeOt/MgO diagram (Miyashiro 1974)*

Description

Assigns data for SiO_2 vs. FeO_t/MgO diagram into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'

Usage

```
Miyashiro()
```

Details

Diagram in SiO_2 vs. FeO_t/MgO space, proposed by *Miyashiro (1974)*, defines the following fields:

Tholeiite Series
Calc-alkaline Series

As the boundary was defined by Akiho Miyashiro as straight line passing through two specific points, no limits of diagram validity for ultrabasic and high-silica rocks were given. Thus, the boundary implemented in GCDkit script spreads from $FeO_t/MgO = 0$ to $SiO_2 = 100\%$.

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	SiO2 weight percent
`y.data`	FeOt/MgO weight percent

Author(s)

Vojtech Erban, <vojtech.erban@geology.cz>
& Vojtech Janousek, <vojtech.janousek@geology.cz>

plotDiagram("Miyashiro", FALSE)
```

`Mode` *Approximating the mode by least-squares method*

Description

The functions '`Mode`' and '`ModeC`' calculate the best approximations of the mode given major-element compositions of the rock and its main mineral constituents. Function '`WRComp`' does the opposite, i.e. yields the whole-rock composition given the chemistry of individual minerals and their modal proportions.

Usage

```
ModeMain(WR,sample.id="",select.oxides=TRUE,select.minerals=TRUE)
Mode(rock, mins,sample.id="")
ModeC(rock, mins,sample.id="")
ModeAll(WR)
WRComp(mins, f)
```

Arguments

`WR`	a numerical matrix; the whole-rock data to be normalized.
`rock`	whole-rock composition of the given sample.
`sample.id`	(optional) sample name.
`select.oxides`	(logical) should be selected oxides used for calculation?
`select.minerals`	(logical) should be selected minerals used for calculation?
`mins`	composition of its main rock-forming minerals.
`f`	their modal proportions.

Details

'`Mode`' uses unconstrained least-squares method taking advantage of the standard R function '`lsfit(mins,rock,intercept=F)`'. It produces results that generally do not sum up to 100 % due to the presence of elements not used in calculation (such as water), and, or, analytical noise.

'`ModeC`' is the constrained variation whose output ought to sum up to 100 % by definition *(Albarede 1995)*. As such it seems to be more appropriate in most applications.

In both cases, the printed output involves the input data, calculated modal proportions of the individual minerals, the calculated composition of the rock (using the auxiliary function '`WRComp`') and differences between the approximated and the real data (residuals).

The sum of squared residuals is a measure of fit (as a rough guide it should be less than ca. 1).

The mineral compositions are provided by a tab-delimited ASCII file, whose first row contains the names of the determined oxides, the following ones start with the mineral abbreviation and the numeric data (hence the first row has one item less than the following ones).

'`ModeMain`' is entry point to both '`Mode`' and '`ModeC`' that enables the user to read the mineral data file, select the oxides and minerals to be used in the calculation.

The options '`select.oxides=FALSE`' and '`select.minerals=FALSE`' read the mineral file in its entirety, using all minerals and oxides present.

'ModeAll' is a front end that performs the constrained least squares calculation for samples specified by the function selectSamples.

Value

'ModeMain', 'Mode' and 'ModeC' return a list with two items. The first of them ('table') is a matrix with the real composition of the rock and its minerals, the calculated whole-rock composition and the residuals. The second ('(un)constrained') returns calculated mineral proportions and sum of squared residuals.

'ModeAll' returns a simple matrix listing, for each rock sample, calculated proportions of rock-forming minerals and the sum of squared residuals.

'WRComp' yields a vector with the calculated whole-rock composition.

mode2<-ModeC(rock,mins)
```

Molecular weights *Calculating molecularWeights of oxides*

Description

These functions plot multiple binary plots with a common x axis, such as Harker plots.

Usage

```
molecularWeight(formula)
```

Arguments

formula	a character vector of length 1, a formula of the oxide.

Details

So far only simple oxide formulae in form of A_xO_y (where x, y are optional indexes) can be handled. The atomic weights are stored in a file `MW.data`.

Value

A list with items:

MW	molecularWeight
x.atoms	number of atoms in the formula
x.oxygen	number of oxygens

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
molecularWeight("SiO2")

molecularWeight("SiO2")[[1]]

oxides<-c("SiO2","TiO2","Al2O3","Fe2O3","FeO")
sapply(oxides,molecularWeight)
```

Mullen *Mullen (1983) 10MnO-TiO2-10P2O5*

Description

Assigns data for the diagram of *Mullen (1983)* into Figaro template (list 'sheet') and appropriate values into 'x.data' and 'y.data'.

Usage

```
Mullen()
```

Details

Triangular diagram with apices 10MnO, TiO_2 and $10P_2O_5$, proposed by *Mullen (1983)*. Abbreviations used in diagram represent following geotectonic settings:

CAB	*Calc-Alkaline Basalts*
IAT	*Island Arc Tholeiites*
MORB	*Mid-Ocean Ridge Basalts*
OIA	*Ocean Island Andesites*
OIT	*Ocean Island Tholeiites*

Value

`sheet` list with Figaro Style Sheet data

`x.data, y.data`
10MnO, TiO_2 and $10P_2O_5$ in wt. % recalculated to 2D

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

```

`Multiple plots` *Multiple binary plots*

Description

These functions plot multiple binary plots with a common x axis, such as Harker plots.

Usage

```
multiple(x,y=paste(colnames(WR),sep=","),
    samples=rownames(WR),pch=labels$Symbol,
    col=labels$Colour,xmin=NULL,xmax=NULL,GUI=FALSE,nrow=NULL,ncol=NULL,...)

multipleMjr(x = "",
    y = "SiO2,TiO2,Al2O3,FeOt,MgO,CaO,Na2O,K2O,P2O5",
    pch = labels$Symbol, col = labels$Colour, ...)
multipleTrc(x = "",
    y = "Rb,Sr,Ba,Cr,Ni,La,Ce,Y,Zr,mg#,A/CNK,K2O/Na2O",
    pch = labels$Symbol, col = labels$Colour, ...)
```

Arguments

`x`	a character vector, name of the common x axis. Formulae are OK.
`y`	a character vector, names of oxides/elements to be plotted as y axes separated by commas. Formulae are OK.
`nrow, ncol`	dimensions of the plots' matrix
`samples`	character or numeric vector; specification of the samples to be plotted.
`pch`	plotting symbols.
`col`	plotting colours.
`xmin, xmax`	minimum and maximum for the x axis.
`GUI`	logical; is the call being made from within GCDkit GUI or not?
`...`	further graphical parameters: see 'help(par) for details.

Details

If x axis occurs among the arguments to be plotted as y axes, it is skipped.

Functions 'multipleMjr' and 'multipleTrc' are entry points supplying the default lists for major- and trace elements.

Even though as a default is assumed a list of major (SiO2, TiO2, Al2O3, FeOt, MnO, MgO, CaO, Na2O, K2O) or trace (Rb, Sr, Ba, Cr, Ni, La, Ce, Y, Zr and mg#) elements, the variable(s) to be displayed can be specified.

The easiest way is to type directly the names of the columns, separated by commas. Alternatively can be used their sequence numbers or ranges. Also built-in lists can be employed, such as 'LILE', 'REE', 'major' and 'HFSE' or their combinations with the column names.

These lists are simple character vectors, and additional ones can be built by the user (see Examples). Note that currently only a single, stand-alone, user-defined list can be employed as a search criterion.

In the specification of the x axis or any of the y axes can be used also arithmetic expressions, see calcCore for the correct syntax.

Lastly, the user is asked to enter the limits for the x axis, two numbers separated by a comma. Note that the scaling takes into account the size of the plotting symbols, i.e. the axes are extended somewhat.

Value

None.

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

multipleTrc("Zr")
# Plots the default trace-element set against the Zr
```

`mzSaturation` *Monazite saturation (Montel 1993)*

Description

Calculates monazite saturation temperatures for given major-element compositions and LREE contents of the magma.

Usage

```
mzSaturation(cats = milli,
    REE = filterOut(WR, c("La", "Ce", "Pr","Nd","Sm", "Gd"), 1),
    H2O = 3, Xmz = 0)
```

Arguments

`cats`	numeric matrix; whole-rock data recast to millications
`REE`	numeric matrix with LREE concentrations - only complete set of La-Gd
`H2O`	assumed water contents of the magma
`Xmz`	mole fractions of the REE-phosphates in monazite

Details

This function uses saturation model of *Montel (1993)*. The formulae are as follows:

$$LREE = \frac{\sum(\frac{REE_i}{at.weight(REEi)})}{Xmz}$$

where REE_i: La, Ce, Pr, Nd, Sm, Gd.

$$Dmz = 100\frac{Na + K + 2Ca}{Al} . \frac{1}{Al + Si}$$

$$Tmz.sat.C = \frac{13318}{9.5 + 2.34Dmz + 0.3879\sqrt{H_2O} - ln(LREE)} - 273.15$$

Value

Returns a matrix '`results`' with the following components:

`Dmz`	distribution coefficient
`Tmz.sat.C`	monazite saturation temperature

Plugin

Saturation.r

Author(s)

Vojtech Janousek, <`vojtech.janousek@geology.cz`>

References

Montel J M (1993) A model for monazite/melt equilibrium and application to the generation of granitic magmas. Chem Geol 110: 127-146 doi: 10.1016/0009-2541(93)90250-M

`NaAlK` *Na2O - Al2O3 - K2O (mol. %) diagram*

Description

Assigns data for ternary diagram Na_2O - Al_2O_3 - K_2O (mol. %) into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'. Calculates molar concentrations of alkalis and alumina, as well as several molar ratios involving these three oxides.

Usage

```
NaAlK()
```

Details

Ternary plot Na_2O - Al_2O_3 - K_2O (mol. %). Dashed lines define the following compositional fields (all oxides are expressed in mol. %):

peraluminous + metaluminous (*Shand 1943*)	$(Na_2O + K_2O)/Al_2O_3 < 1$
peralkaline (*Shand 1943*)	$(Na_2O + K_2O)/Al_2O_3 > 1$
perpotassic	$K_2O/Al_2O_3 > 1$ and $K_2O/Na_2O > 1$
potassic	$1 < K_2O/Na_2O < 3$
ultrapotassic	$K_2O/Na_2O >= 3$

The molar ratio of $K_2O/Na_2O >= 3$, is equivalent to $K_2O/Na_2O >= 2$ in wt. %, i.e. to the definition of ultrapotassic igneous rocks by *Foley et al. (1987)*.

Value

`sheet`	list with Figaro Style Sheet data
`x.data, y.data`	Na_2O, Al_2O_3 and K_2O contents in mol. % transformed into 2D
`Na2O`	Na_2O in mol. %
`Al2O3`	Al_2O_3 in mol. %
`K2O`	K_2O in mol. %
`(Na2O+K2O)/Al2O3`	molecular ratio $(Na_2O + K_2O)/Al_2O_3$
`K2O/Al2O3`	molecular ratio K_2O/Al_2O_3
`K2O/Na2O`	molecular ratio K_2O/Na_2O

```

`Niggli` *Niggli's values*

Description

Calculates cationic parameters of *Niggli (1948)*.

Usage

```
Niggli(WR, precision = getOption("gcd.digits"))
```

Arguments

`WR`	a numerical matrix; the whole-rock data to be normalized.
`precision`	precision of the result.

Details

The calculated parameters are:

`si, al, fm, c, alk, k, mg, ti, p, c/fm, qz`

Value

A numeric matrix '`results`'.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

References

Niggli P (1948) Gesteine und Minerallagerstatten. Birkhauser, Basel, p. 1-540

`OConnor` *Classification diagram for siliceous igneous rocks, based on Fsp composition (O'Connor 1965)*

Description

Assigns data for O'Connor's triangular diagram into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
OConnorVolc()

OConnorPlut()
```

Details

The O'Connor's triangular diagram is based on combination of Albite, Anorthite and K-feldspar modal or normative data. While the function '`OConnorPlut`' can plot either modal or normative diagrams for plutonic rocks, '`OConnorVolc`' is to be used exclusively with normative data computed from chemical compositions of volcanic rocks.

In fact, the triangle represents projection of the Quartz - K-feldspar - Albite - Anorthite tetrahedron. All three diagrams are designed for quartz-rich rocks, i.e. those with quartz contents higher than 10 such silica-rich samples, the rock type can be determined purely on the basis of the feldspars' proportions.

As the specific version of the normative calculation is not mentioned in the original paper by '*O'Connor (1965)*', the function '`CIPW`', designed after '*Hutchison (1974, 1975)*' was implemented.

Value

`sheet` list with Figaro Style Sheet data

`x.data, y.data`
An, Ab and Or data (see details) transformed to orthogonal coordinates

`pairsCorr` *Statistics: Correlation*

Description

Plots a matrix of scatterplots in the lower panel and one of other pre-defined panel functions in the upper.

Usage

```
pairsCorr(elems = major)

pairsMjr()

pairsTrc()
```

Arguments

`elems`	list of desired elements

Details

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

Even though a list of major elements is assumed as a default, different variables can be specified by the function '`selectColumnsLabels`'.

The upper panels to choose from are:

'`panel.corr`'	Prints correlations, with size proportional to the correlations;
'`panel.cov`'	Prints covariances;
'`panel.smooth`'	Fits smooth trendlines;
'`panel.hist`'	Plots frequency histograms.

Value

None.

Warning

Names of existing numeric data columns and not formulae involving these can be handled at this stage.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

Examples

```
pairsCorr(LILE)
```

```
pairsMjr()

pairsTrc()

# user-defined list
my.elems<-c("Rb","Sr","Ba")
pairsCorr(my.elems)
```

`pdfAll` *Save all graphics to PDF*

Description

Saves all graphical windows to a single PDF file.

Usage

```
pdfAll()
```

Arguments

None.

Details

The function prompts for filename under which it saves all graphical windows, each on a separate page. PDF is the most portable format, that should preserve practically the same layout on all platforms.

Individual diagram can be saved from a menu that appears after clicking on the appropriate graphical window ('`File|Save as|PDF`').

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

'`psAll`' '`pdf`'

`Pearce 1982` *Pearce (1982)*

Description

Assigns data for the diagram of *Pearce (1982)* into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
Pearce1982()
```

Details

Diagram proposed by *Pearce (1982)* for geotectonic discrimination between lavas from distinct geotectonic positions:

Within-plate lavas
Island-arc lavas
Mid-ocean Ridge Basalts

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	Zr ppm
`y.data`	Ti ppm

Author(s)

Jean-Francois Moyen, `<jfmoyen@gmail.com>`

`Pearce and Cann` *Pearce and Cann (1973)*

Description

Plots data stored in '`WR`' (or its subset) into Pearce and Cann's diagrams.

Usage

```
Cann(plot.txt = getOption("gcd.plot.text"))
```

Arguments

`plot.txt`	logical, annotate fields by their names?

Details

Set of two triangular and one binary diagram, proposed by *Pearce & Cann (1973)*. Following abbreviations are used:

IAT	*Low-K Tholeiites*
MORB	*Ocean Floor Basalts*
CAB	*Island Arc Basalts*
WPB	*Within Plate Basalts*

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

`Pearce et al. 1977`

Pearce et al. (1977) MgO-FeOt-Al2O3

Description

Assigns data for the MgO-FeOt-Al_2O_3 triangle proposed by *Pearce et al.(1977)* into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
PearceEtAl()
```

Details

Triangular diagram with apices MgO, FeOt and Al_2O_3, proposed by *Pearce et al.(1977)*. The boundaries were defined solely for subalkaline volcanic rocks with SiO_2 between 51-56 wt %. Following geotectonic positions may be identified using the diagram:

Spreading Center
Orogenic
Ocean Ridge
Ocean Island
Continental

Value

`sheet` list with Figaro Style Sheet data

`Pearce1996`	*Nb/Y - Zr/Ti diagram (Winchester + Floyd 1977, modified by Pearce 1996)*

Description

Assigns data for Nb/Y vs. Zr/Ti diagram into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
Pearce1996()
```

Details

Classification diagram proposed by *Winchester & Floyd (1977)* using incompatible element ratios (Nb/Y vs. Zr/Ti). As the original plot has been designed prior to the publication of the TAS diagram *Le Bas et al. 1986*, the field definition has been subsequently modified by *Pearce (1996)*. The following fields are defined:

(Subalkaline) Basalt
Alkali basalt
Foidite
Andesite/Basaltic andesite
Trachyandesite
Tephriphonolite
Rhyolite/Dacite
Trachyte
Phonolite
Alkali Rhyolite

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	Nb/Y wt. % ratio
`y.data`	Zr/Ti wt. % ratio

```

PearceGranite *Pearce et al. (1984)*

Description

Assigns Figaro templates to Pearce's geotectonic diagrams for granitoids into the list 'plate') and appropriate values into the list 'plate.data' for subsequent plotting.

Usage

```
PearceGranite(plot.txt = getOption("gcd.plot.text"))
```

Arguments

plot.txt	logical, annotate fields by their names?

Details

Suite of four diagrams for discrimination of geotectonic environment of granitoid rocks, proposed by *Pearce et al. (1984)*. It is based on combination of five trace elements (namely Y, Nb, Rb, Yb and Ta). Following geotectonic settings may be deduced:

Abbreviation used	Environment
ORG	*Ocean Ridge Granites*
VAG	*Volcanic Arc Granites*
WPG	*Within Plate Granites*
COLG	*Collision Granites*

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See Plate, Plate editing and figaro for details.

PeceTaylor *SiO2-K2O diagram (Peccerillo + Taylor 1976)*

Description

Assigns data for SiO_2 vs. K_2O diagram into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'

Usage

```
PeceTaylor()
```

Details

Diagram in SiO_2 vs. K_2O space, proposed by *Peccerillo & Taylor (1976)*, defines the following fields:

Tholeiite Series
Calc-alkaline Series
High-K Calc-alkaline Series
Shoshonite Series

Field boundaries were linearly extrapolated up to 75% of SiO_2 between 'Calc-alkaline Series' and 'High-K Calc-alkaline Series', and up to 70% of SiO_2 between 'High-K Calc-alkaline Series' and 'Shoshonite Series'. To employ boundaries as originally defined by *Peccerillo & Taylor (1976)*, change the value of variable 'extrapolated' to 'FALSE' in the file '[R-root] \ library \ GCDkit \ Diagrams \ Classification \ PeceTaylor.r'. Also note that the second value for the middle boundary (i.e. [52,1.5]) is in the original paper obviously misquoted as 1.3 .

Rocks with composition falling beyond defined boundaries are labeled *'undefined'* by the 'classify' function.

For comparison with similar diagrams used by other authors see *Rickwood (1989)*.

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	SiO2 weight percent
`y.data`	K2O weight percent

```

---

peterplot *Anomaly plot*

Description

This function plots a conventional binary diagram but the type and size of the plotting symbols is assigned according to the distribution of a third, conditioning variable.

Usage

```
peterplot(xaxis = "", yaxis = "", zaxis = "", ident = FALSE,
scaling.small = labels[1,"Size"], scaling.big = 2 * scaling.small,
assign.symbols = FALSE)
```

Arguments

xaxis, yaxis	character; specification of the axes
zaxis	character; conditioning variable
ident	logical; identify the individual points?
scaling.small	scaling factor for the smaller plotting symbols
scaling.big	scaling factor for the larger plotting symbols
assign.symbols	logical; should be the plotting symbols and their sizes assigned permanently?

Details

If no parameters `xaxis, yaxis` and `zaxis` are specified, the user is prompted to do so interactively.

The plotting symbols are assigned as follows: the values within 25 quartiles) obtain a `dot`, the higher ones are denoted by '+'and lower ones by '−'. If the given value is an outlier, its plotting size is doubled.

Optionally, the user can assign the plotting symbols and their sizes permanently, for use in other diagrams throughout the system.

Value

May modify the variable `cex`, as well as the codes of plotting symbols stored in the data frame `labels`.

Plate *Plotting plates of several diagrams*

Description

Functions to set up, save or load a so-called 'plate', i.e. a regular grid of slots to accommodate (any mixture of) binary or ternary plots, spiderplots or such alike. For instance, Harker plots are implemented using the plate concept.

Usage

```
multiplePerPage(which=NULL,nrow=NULL,ncol=NULL,title="Plate",
dummy=TRUE)

Plate(scr=NULL)

plateRedraw(device="windows",filename=NULL,colormodel="rgb")

platePS(colormodel="rgb")

plateSave()
```

```
plateLoad()
```

Arguments

`which`	total number of slots to be occupied by individual diagrams.
`nrow`	number of rows in the plots' matrix.
`ncol`	number of columns in the plots' matrix.
`title`	title for the whole plate.
`dummy`	logical; if TRUE, dummy plots are shown. See Details.
`scr`	(optional) number of screen to be selected.
`device`	output device; either `'windows'` or `'postscript'`.
`filename`	name of file if output redirected to Postscript.
`colormodel`	color mode for Postscript; `'rgb'` or `'gray'`.

Details

The function `'multiplePerPage'` serves to setting up a matrix of slots, each of which could be taken by a single Figaro-compatible diagram (a binary plot, a ternary plot, a spiderplot,...). If `'which'` is NULL, the function asks for their number, and then suggests number of rows (`'nrow'`) and columns (`'ncol'`) for the matrix arrangement.

If desired, the slots can be filled by the so-called 'dummy plots', i.e. gray boxes showing the exact position and the size of each of them.

If `'which'` is an integer, specified number of slots is allocated. Alternatively, this argument may represent a vector containing any mixture of names of diagrams that can be plotted by the function `plotDiagram` or even plotting commands themselves used to fill the individual slots directly. See Examples.

Once set up, a single slot can be selected for further work using the function `'Plate'`. The function can be called directly, with the number of the screen desired. If none is specified, a red box-like cursor appears in the graphical window, which can be moved around using the cursor keys, `Spacebar` or by mouse. The appropriate slot can be chosen by left mouse button or by pressing `Enter`. Right-click anywhere on the plate invokes a context menu which enables several actions:

Menu item	**Function**
Introduce plot	Select a new Figaro-compatible diagram for this slot.
Plot editing	Modify the existing diagram (similarly to the menu `Plot editing` for stand alone plots).
Plate editing	Functions to modify the overall plate properties or all its diagrams simultaneously.

The function `'plateRedraw'` serves for replotting a 'clean! version of the whole plate, eg. for saving/printing, For this purpose, its output can be redirected to Postscript, either in colour or as black and white. As a wrapper for the Postscript output serves the function `'platePS'`

The functions `'plateSave'` and `'plateLoad'` are designed to save and retrieve definitions of plates (Figaro sheets and the relevant data) for later use. The default suffix for the saved plates is 'mgr'. Note that only the data needed for the plotting ('x.data', 'y.data') are stored in the 'mgr' files. Thus the data set currently in memory (e.g., variables 'WR', 'labels', ...) is unaffected by the function 'plateLoad'.

Starting with GCDkit version 3, the plates concept is used by some built-in functions, such as 'Multiple plots' (function `multiple`) or 'Multiple plots by groups' (function `figMulti`).

Value

`plate`	list of Figaro definitions for individual diagrams
`plate.data`	list containing `'x.data'` and `'y.data'` for each of them

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

See Also

Plate editing, plotPlate, multiple, figMulti, plot, binary, ternary, spider, figaro, figLoad, figSave

Examples

```
data<-loadData("sazava.data",sep="\t")
multiplePerPage(which=c("binary(\"K2O/Na2O\",
    \"Rb\",new=FALSE)",
    "DebonPQ","AFM","PeceTaylor","Shand"))

Plate()

Plate(3)
plotDiagram("LarochePlut",FALSE,FALSE)
```

`Plate editing` *Editing the plate properties/all its plots simultaneously*

Description

A collection of functions to modify the properties of a plate (or all its diagrams) simultaneously.

Usage

```
plateXLim(xlim=NULL)

plateYLim(ylim=NULL)

plate0YLim()

plateCex(n=NULL)

plateCexLab(n=NULL)

plateCexMain(n=NULL)

plateAnnotationsRemove()

platePch(pch=NULL)

plateCol(col=NULL)
```

```
plateBW()

plateExpand(scr=NULL)

plateExtract(diagram,which=NULL,...)
```

Arguments

`xlim`	scaling for the x axis
`ylim`	scaling for the y axis
`n`	relative size (use n = 1 for normal one).
`pch`	plotting symbol specification, either as string or a numeric code (showSymbols).
`col`	colour specification, either by its English name, or by a numeric code (showColours).
`scr`	number of screen to be expanded.
`diagram`	name of the function plotting a plate.
`which`	sequential number of plot in its definition.
`...`	additional parameters to the diagram (plate) plotting function.

Details

The functions serve to change properties of all particular diagrams forming the given plate. They can be used to set up the uniform size of plotting symbols (`'plateCex'`), main title (`'plateCexMain'`) or of the axes' labels (`'plateCexLab'`), remove the annotation of classification fields (`'plateAnnotationsRemo`
uniform plotting symbol (`'platePch'`) and/or colour (`'plateCol'`) to all plots, or set them into black and white (`'plateAnnoRemove'`). If the same variable is plotted as x or y axis in all diagrams forming the plate (e.g., on Harker plots), it can be scaled by means of the functions `'plateXLim'` and `'plateYLim'`. Using the command `'plate0YLim'` it is possible to set the origin of all non-logarithmic y axes to zero.

The function `'plateExpand'` displays a zoomed up version of the selected diagram in a separate window.

The function `'plateExtract'` extracts a Figaro definition of a single plot from a plate plotted by the function `'diagram'`.

Value

None.

`plotPlate` *Plot Plate of Diagrams*

Description

Plots a plate of diagrams, based on the Figaro style sheets.

Usage

```
plotPlate(diagram,where="WR",...)
```

Arguments

`diagram`	a valid name of the function that uses the plate concept to plot the given diagram. See Details.

where	name of the data matrix/data frame, columns of which are to be used for plotting.
...	optional parameters for the diagram function call.

Details

The argument 'diagram' may acquire one of following values:

```
'Maniar' 'Frost' 'PearceGranite' 'Schandl'
'Verma' 'Agrawal' 'Cann' 'Wood'
```

Value

none

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See Plate, Plate editing and figaro for details.

Plate, Plate editing, figaro

Examples

```
plotPlate("PearceGranite")
```

---

plotWithCircles *xyz plotWithCircles*

Description

Plots a binary diagram of two specified variables and the whole dataset or its selection. The size and colours of the plotted circles correspond to the third.

Usage

```
plotWithCircles(xaxis = "", yaxis = "", zaxis = "",
    colour = "heat.colors", scaling.factor = NULL,
    bins = NULL, ident = getOption("gcd.ident"))
```

Arguments

xaxis	Name of the data column to be used as x axis.
yaxis	Name of the data column to be used as y axis.
zaxis	Name of the data column to determine the size/colour of the circles.
colour	colour scheme for the circles.
scaling.factor	a factor determine the size of the circles.
bins	number of intervals for the legend.
ident	Logical: should be the individual samples identified?

Details

If no parameters 'xlab', 'ylab' and 'zlab' are given, the user is prompted to specify them.

The variables are selected using the function 'selectColumnLabel.

In the specification of the apices can be used also arithmetic expressions, see calcCore for the correct syntax.

The samples to be plotted can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSubset for details.

The legal colour schemes are: '"grays","reds","blues","greens","cyans","violets","yellows",
"heat.colors","terrain.colors","topo.colors","rainbow"'.

Value

None.

Warning

This function IS NOT Figaro-compatible.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

& Vojtech Erban, <vojtech.erban@geology.cz>

Examples

```
plotWithCircles("SiO2","Na2O+K2O","MgO+FeOt",colour="rainbow")

plotWithCircles("SiO2","MgO","K2O",colour="grays",scaling.factor=0.5,ident=TRUE)
```

`prComp` *Statistics: Principal components*

Description

Performs principal components analysis (scaled variables, covariance or correlation matrix) and plots a biplot *(Gabriel, 1971)*.

Usage

```
prComp(elems = "SiO2,TiO2,Al2O3,FeOt,MnO,MgO,CaO,Na2O,K2O",...)
```

Arguments

`elems`	numerical columns to be used for principal components analysis, typically major elements
`...`	additional parameters

Details

Biplot aims to represent both the observations and variables of a data matrix on a single bivariate plot *(Gabriel, 1971; Buccianti & Peccerillo, 1999)*.

In the biplots, the length of the individual arrows is proportional to the relative variation of each variable. A comparable direction of two arrows implies that both variables are positively correlated; the opposite one indicates a strong negative correlation. When two links are perpendicular it indicates independence of the two variables *(Buccianti & Peccerillo, 1999)*.

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

Even though a list of major elements is assumed as a default, different variables can be specified by the function '`selectColumnsLabels`'.

Value

None.

Warning

Names of existing numeric data columns and not formulae involving these can be handled at this stage. Only complete cases are used for the principal components analysis.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

`printSamples` *Display samples*

Description

Displays specified combination of numeric variable(s) and/or labels for selected range of samples.

Usage

```
printSamples(elems=NULL,which=NULL,select.samples=FALSE)
```

Arguments

`elems`	list of variables to be printed
`which`	list of samples, useful only for select.samples=FALSE
`select.samples`	logical: if TRUE, samples can be chosen using the appropriate dialogue

Details

This function prints the desired numerical columns, textual labels, or their combinations, for selected samples.

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

The variables to be printed are chosen by the function '`selectColumnsLabels`'. In the specification of the variable can be used also arithmetic expressions, see `calcCore` for the correct syntax.

Value

`results`	data matrix with the desired data for the specified samples

## End(Not run)
```

`printSingle` *Display a variable*

Description

Displays a single numeric variable or a result of a calculation.

Usage

```
printSingle(default="")
```

Arguments

`default`	character: list of default column names, separated by commas.

Details

The variable to be printed is selected using the function '`selectColumnLabel`'. In the specification of the variable can be used also arithmetic expressions, see `calcCore` for the correct syntax.

In the specification of the variable can be used also arithmetic expressions, see `calcCore` for the correct syntax.

Value

`results`	numerical vector/matrix with the results

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

Examples

```
## Not run:
# examples of valid formulae....
(Na2O+K2O)/CaO
Rb^2
log10(Sr)
mean(SiO2)/10

# ... but this command is in fact a simple R shell -
# meaning lots of fun for power users!
summary(Rb,na.rm=TRUE)
cbind(SiO2/2,TiO2,Na2O+K2O)
cbind(major)
hist(SiO2,col="red")
boxplot(Rb~factor(groups))

# possibilities are endless
plot(Rb,Sr,col="blue",pch="+",xlab="Rb (ppm)",ylab="Sr (ppm)",log="xy")

## End(Not run)
```

`profiler` *Profile plotting*

Description

Plotting geochemical profiles. As a x axis can be specified an arbitrary variable or an numerical interval (for equidistant measurements).

Usage

```
profiler(x = NULL, y = NULL, method = "Variable", legend = FALSE,
    pch = 1, col = "black", cex = 1, xaxs = "r", yaxs = "i",
    main = "",xmin = NULL, xmax = NULL)
```

Arguments

`x`	character; optional name of variable to be plotted as x axis.
`y`	character; name(s) of variable(s) for individual profiles.
`method`	character; which of the methods is to be used? Valid are "Variable","Equidistant" or "From-To".
`legend`	logical; should be plotted also legend (in a separate window)?
`pch`	plotting symbols specification.
`col`	plotting colour(s).
`cex`	numeric; relative size of the plotting symbols.
`xaxs, yaxs`	character; type of the axes. See `par` for details.
`main`	character; main title for the plot
`xmin, xmax`	range of the x axis (for methods '`Variable`' and '`From/To`'))

Details

The function 'profiler' serves for plotting three different types of profiles involving a single or several geochemical parameters.

The first one, 'Variable' uses any numeric variable as the x axis (e.g., SiO2 contents, depth...). It is in fact a special type of a binary plot, in which the data points are, for each of the y-axis variables, joined by a line.

The remaining two methods are very similar to each other. The x axis is in both cases equidistant, and the order of the individual samples follows from their sequence in the data set.

The method 'Equidistant' uses simply the sequence number of the individual samples in the data set. It does not label the x-axis, just prints the number of samples used for plotting.

The method 'From/To' serves for drawing equidistant profiles, where the x axis can be specified by an interval.

In the specification of the x axis (for the method 'Variable') or any of the y variables (all methods) can be used also arithmetic expressions, see calcCore for the correct syntax.

If not called from the command prompt, the samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSubset for details.

The easiest way to specify the variable(s) to be plotted on individual profile(s) is to type directly the names of the columns, separated by commas. Alternatively can be used their sequence numbers or ranges. Also built-in lists can be employed, such as 'LILE', 'REE', 'major' and 'HFSE' or their combinations with the column names.

These lists are simple character vectors, and additional ones can be built by the user (see Examples). Note that currently only a single, stand-alone, user-defined list can be employed as a search criterion.

If the function is not called from the command prompt, and it desired so, the symbols and colours for each of the profiles can be specified separately in a simple spreadsheet-like interface.

If x axis occurs among the arguments to be plotted as y axes, it is skipped.

Likewise the relative scaling of the plotting symbols and the scale of the y axis can be specified.

Lastly, the user is asked to enter the limits for the axes, which are always two numbers separated by a comma.

Value

results	numeric matrix with the values for individual profiles.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
# Profiles of SiO2 versus (scaled) TiO2, MgO and K2O
# if x is specified, method="Variable" assumed automatically
profiler("Na2O+K2O",c("TiO2","6*MgO","SiO2"),pch=c("+","o","@"),col=c("red","blue","darkg

# Equidistant profiles of (scaled) MgO, CaO, and Al2O3 (in sample sequence)
# with default symbols and scaling
profiler(y=c("MgO","3*CaO","2*Al2O3"),method="Equidistant",col=c("red","blue","darkgreen"
```

```
# Equidistant profiles of two calculated variables in custom colour
# and user-defined plotting symbols; range of the x axis will be specified
# interactively
profiler(y=c("2*MgO","10*(Na2O+K2O)"),method="From-To",pch=1:10,
 col=c("blue","red"),cex=1.5,main="My plot",xmin=10,xmax=30)
```

`psAll` *Save all graphics to PS*

Description

Saves all graphical windows to Postscript files.

Usage

```
psAll()
```

Arguments

None.

Details

The function prompts for a common root of the filenames and then saves all graphical windows, each in a separate file, numbering them sequentially. Postscript is the best export format from R, preserving the necessary quality as well as the possibility to be imported by most graphical editors (such as Corel Draw!) for retouching.

Otherwise individual diagram can be saved from a menu that appears after clicking on the appropriate graphical window ('`File|Save as|Postscript`').

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

'`pdfAll`' '`postscript`'

QAPF *QAPF diagram (Streckeisen 1974, 1978)*

Description

Assigns data for Streckeisen's diagram into Figaro template (list 'sheet') and appropriate values into 'x.data' and 'y.data'. The Q, A, P and F coordinates are assigned into matrix 'results'.

Usage

```
QAPFVolc()
QAPFPlut()
```

Details

Following the IUGS recommendation (Le Maitre et al 2002), the QAPF diagram should be the prime classification scheme for holocrystalline plutonic and volcanic rocks containing at least 10% of felsic minerals. The apices are defined as follows:

Q = Quartz modal %

A = Alkali feldspar modal %

P = Plagioclase modal %

F = feldspathoid modal %

Q + A + P + F = 100 %

As the whole QAPF diagram is rather complicated, GCDkit plots just the appropriate triangle if the dataset contains only Si-oversaturated or only Si-undersaturated rock samples. If both kinds of rock samples are present, the whole double triangle is shown. This behaviour may be changed in the source code of the diagram (in file 'QAPFPlut.r' or 'QAPFVolc.r', stored in the subdirectory GCDkit\Diagrams\Classification, change the 'triangle<-"auto"' to 'triangle<-"both"' and complete double triangle will be always plotted).

Value

sheet	list with Figaro Style Sheet data
x.data, y.data	Q, A, P and F data (see details) transformed to orthogonal coordinates

Author(s)

Vojtech Erban, <vojtech.erban@geology.cz>

Examples

```
#plots the QAPF diagram for current dataset

plotDiagram("QAPFVolc", FALSE)

plotDiagram("QAPFPlut", FALSE)

#classifies the current dataset using the QAPF diagram

classify("QAPFVolc")

classify("QAPFPlut")
```

---

quitGCDkit *Exit GCDkit*

Description

Exits GCDkit (nicely).

Usage

```
quitGCDkit()
```

Arguments

None.

Details

By invoking this command the user is not prompted whether he wants to save his unfinished work in the 'Workspace image', i.e. file '.RData' in the main GCDkit directory.

Menu

GCDkit: Exit GCDkit

See Also

'quit'

r2clipboard *Copy results to clipboard*

Description

Copies the most recently calculated results to a clipboard.

Usage

```
r2clipboard(what=results)
```

Arguments

what	a variable to be copied, can be either a vector, a matrix, a list or a table.

Details

Copies the variable 'results' returned by most of the calculation algorithms to the Windows clipboard.

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

recast *Recast to given sum*

Description

Recasts the selected data to a fixed sum.

Usage

```
recast(total = 100)

normalize2total(what = NULL, total = 100)
```

Arguments

what	numeric matrix or character vector with a list of column names to be normalized, separated by commas.
total	a sum the data should be normalized to.

Details

Both functions return the selected elements/oxides (columns in the data matrix 'WR') normalized to the required sum. The function 'recast' is front-end to 'normalize2total'. If 'what' is a comma delimited list, the corresponding columns from the data matrix 'WR' are selected. If 'what' is empty, the user is prompted to supply the list of required column names via the function 'selectColumnsLabels'.

Value

results	numerical vector/matrix with the results

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
normalize2total(major,1)
recast() # to select the sum and elements interactively
```

---

reciprocalIso — *Binary plots of reciprocal element concentration vs initial isotopic composition*

Description

Plots a diagram 1/Sr vs initial Sr isotopic ratios or 1/Nd vs initial $\epsilon(Nd)$ for selected samples.

Usage

```
reciprocalIso()
```

Arguments

None.

Details

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSamples for details.

Value

None.

Plugin

SrNd.r

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

`Regular expressions`
Implementation of regular expressions in GCDkit

Description

Implementation of regular expressions in the searching patterns.

Details

Many enquiries in the GCDkit employ regular expressions. This is a quite powerful searching mechanism more familiar to people working in Unix. Put in simple terms, most characters, including all letters and digits, are regular expressions that match themselves. However, metacharacters with a special meaning ('?' '+' '{' '}' '|' '(' ')') must be preceded by a backslash.

Regular expression	Matches
.	Any character
^	Beginning of the expression
\$	End of the expression
[ ]	Any of the characters given in square brackets
[m-n]	Any character in the range given by m and n

A subexpression is a regular expression enclosed in '\(' and '\)'. Two such subexpressions may be joined by the infix operator '|' (logical or); the resulting regular expression matches any string matching either of them. For instance:

`\(South\)|\(North\)Uist`

yields both

`South Uist` and `North Uist`.

A regular expression may be followed by one of several repetition operators:

Repetition operator	The preceding item will be matched
?	At most once (i.e. is optional)
*	Zero or more times
+	One or more times
{n}	Exactly n times
{n,}	At least n times
{n,m}	At least n times, but not more than m times

---

saveData *Save data file*

Description

Saves modified data set into a specified datafile.

Usage

```
saveData(sep="\t")
```

Arguments

sep	delimiter separating individual items in the data file.

Details

Labels (stored in data frame 'labels') and numeric data (in numeric matrix 'WR') for the currently selected subset are glued together and saved under the specified filename. The format is such that the data can be retrieved again into GCDkit using the loadData command. Note that no mg numbers are currently saved.

Value

None.

saveResults *Save results*

Description

Saves the most recently calculated results to a text file.

Usage

```
saveResults(what = results, sep = "\t", digits = 2)
```

Arguments

what	a variable to be saved, can be either a vector, a matrix or a list.
sep	separator; default is a tab-delimited file.
digits	precision of the results to be saved.

Details

Saves the variable 'results' returned by most of the calculation algorithms to a tab-delimited ASCII file.

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

`saveResultsIso` *Save Sr-Nd isotopic data*

Description

Saves the calculated isotopic parameters stored in the matrix '`init`' to a text file.

Usage

```
saveResultsIso(digits = 6)
```

Arguments

`digits`	precision of the results to be saved.

Details

Saves the data matrix `init` with the following columns:

Age (Ma)	Age in Ma
87Sr/86Sri	Initial Sr isotopic ratios
143Nd/144Ndi	Initial Nd isotopic ratios
EpsNdi	Initial $\epsilon(Nd)$ values
TDM	Single-stage depleted-mantle Nd model ages *(Liew & Hofmann, 1988)*
TDM.Gold	Single-stage depleted-mantle Nd model ages *(Goldstein et al., 1988)*
TDM.2stg	Two-stage depleted-mantle Nd model ages *(Liew & Hofmann, 1988)*

Value

None.

sazava — *Whole-rock composition of the Sazava suite, Central Bohemian Plutonic Complex*

Description

This data set gives the whole-rock major- and trace-element contents in selected samples (gabbros, quartz diorites, tonalites and trondhjemites) of the c. 355 My calc-alkaline Sazava suite of the Variscan Central Bohemian Plutonic Complex (Bohemian Massif, Czech Republic).

Usage

```
data(sazava)
accessVar("sazava")
```

Format

A data frame containing 14 observations.

Schandl — *Schandl and Gorton (2002)*

Description

Plots data stored in 'WR' (or its subset) into the classification diagrams after *Schandl and Gorton (2002)*.

Usage

```
Schandl(plot.txt = getOption("gcd.plot.text"))
```

Arguments

plot.txt	logical, annotate fields by their names?

Details

Suite of four diagrams for geotectonic environment discrimination of felsic volcanic rocks (rhyolites), proposed by *Schandl and Gorton (2002)*. It is based on combination of four presumably little immobile trace elements (namely Ta, Yb, Th, and Hf).

Diagrams were designed to decipher the geotectonic setting of felsic volcanic suites, specifically those associated with the volcanogenic massive sulphide (VMS) deposits.

a) Ta/Yb versus Th/Yb diagram from *Gorton and Schandl (2000)* is divided into three fields: Oceanic Arcs, Active Continental Margins (ACM) and Within-Plate Volcanic Zones (WPVZ).

The Within-Plate Basalts (WPB) and Mid-Ocean Ridge Basalts (MORB) represent compositions previously determined by *Pearce (1982, 1983)*.

b) Ta vs. Th diagram demonstrates the Th enrichment of felsic volcanic rocks at post-Archaean VMS deposits (and of some unmineralized Archaean rhyolites) with respect to Ta.

c) Graph of Ta/Hf vs Th/Hf ratios shows the similar incompatibility between Th and Ta in two different tectonic environments: Active Continental Margins and Within-Plate Volcanic Zones.

d) Yb vs. Th/Ta diagram with fields for associations of Oceanic Arcs, Active Continental Margins, Within Plate Volcanic Zones and MORB.

Taken together, the following geotectonic settings may be deduced:

Rock Association	**Abbreviation**
Oceanic Arcs	
Active Continental Margins	ACM
Within-Plate Volcanic Zones	WPVZ

Further abbreviations used on the plots:

Rock Association	**Abbreviation**
Mid-Oceanic Ridge Basalts	MORB
Within-Plate Basalts	WPB

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

plotPlate("Schandl")
```

---

selectAll *Select whole dataset*

Description

Restores data for all samples as they were loaded from a data file.

Usage

```
selectAll(GUI=FALSE)
```

Arguments

GUI	logical; was the function called from the GUI?.

Details

When a datafile is loaded into GCDkit using the `loadData` function, the data and their backup copy are stored in the memory.

The subsets of the current dataset can be chosen using the functions `selectByLabel` and `selectSubset` (menus `'Select subset by sample name}\cr \code{or label', 'Select subset by range', 'Select subset by Boolean'`) and the current data will be replaced by their newly chosen subset.

The backup copy is kept intact ever since the `loadData` function has been invoked and can be uploaded any time in place of the current data set using the function '`selectAll`'. Note that all changes made e.g. to plotting symbols, grouping, newly calculated variables etc. will be lost.

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

selectByDiagram *Selecting subset by diagram*

Description

This function enables selecting samples that plot into certain field(s) of the given classification diagram.

Usage

```
selectByDiagram(diagram =  select.list(claslist[, "menu"]))
```

Arguments

diagram	one of the valid diagram names that appear in '.claslist()'

Details

The diagram can be chosen from a list (the default) or specified directly as an argument. Clicking onto a field toggles its inclusion/exclusion - the currently selected fields are cyan.

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz> & Vojtech Erban, <vojtech.erban@geology.cz>

See Also

'selectByLabel', 'selectSubset', 'selectAll' and 'classify'.

Examples

```
.claslist() # names of existing diagrams
selectByDiagram("TAS")
```

selectByLabel *Select subset by sample name or label*

Description

Selecting subsets of the data stored in memory by searching sample names or a single label.

Usage

```
selectByLabel()
```

Details

This function enables the user to query a single textual column, a label, chosen using the function 'selectColumnLabel'. The current data will be replaced by its newly chosen subset. These enquiries employ regular expressions.

Value

Overwrites the data frame 'labels' and numeric matrix 'WR' by subset that fulfills the search criteria.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
## Not run:
# Subset by label

```

```
## End(Not run)
```

`selectColumnLabel` *Selecting a single variable in GCDkit*

Description

This is an auxiliary function invoked by many others to select a single variable.

Usage

```
selectColumnLabel(where = colnames(labels),
message = "Select the variable\nor press ENTER to pick from a list",
default = "", sample.names = FALSE, silent = FALSE, print = TRUE,
empty.ok = TRUE)
```

Arguments

`where`	names of data columns to choose from
`message`	prompt
`default`	comma delimited list of default names
`sample.names`	logical; should be the sample names listed
`silent`	logical, echo on/off
`print`	logical, echo on/off
`empty.ok`	is empty selection ok?

Details

The easiest way for specification of the variable is to type directly the name of the numerical column in the data matrix 'WR' (e.g., 'SiO2') or its sequence number (2 for the second column). However, it is not necessary to enter the name in its entirety. Only a substring that appears somewhere in the column name or other forms of `regular.expressions` can be specified.

If the result is ambiguous, the correct variable has to be selected by mouse from the list of the multiple matches. Ultimately, empty response invokes list of all variables available in the memory.

Value

A numeric index of the selected column.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

`selectColumnsLabels`

`selectColumnsLabels` *Selecting several data columns*

Description

An auxiliary function invoked by many others to select several variables simultaneously.

Usage

```
selectColumnsLabels(where = colnames(WR),
message = "Select variable(s), e.g. 'SiO2,TiO2,MgO'
or press ENTER to pick from a list", default = "", print = TRUE,
exact.only = TRUE)
```

Arguments

`where`	vector of names for data columns to choose from
`message`	prompt
`default`	comma delimited list of default names
`print`	logical, echo on/off
`exact.only`	logical, should be the input checked for correctness?

Details

The variable(s) can be specified in several ways. The easiest is to type directly the name(s) of the column(s), separated by commas. Alternatively can be used their sequence numbers or ranges. Also built-in lists can be employed, such as `'LILE', 'REE', 'major'` and `'HFSE'` or their combinations with the column names.

These lists are simple character vectors, and additional ones can be built by the user (see Examples). Note that currently only a single, stand-alone, user-defined list can be employed as a search criterion.

Empty response invokes list of all variables available. The correct variables have to be selected by mouse + SHIFT from this list.

If `exact.only=TRUE`, the individual items in the input line are checked against the list of existing column/variable names (i.e. components in the vector `'where'`.

Value

Vector with the selected column names.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

Examples

```

Search pattern = my.elems
Rb, Sr, Ba

## End(Not run)
```

`selectNorm` *Selecting the normalization data for spiderplots*

Description

Displays available normalization schemes and lets the user to choose one interactively.

Usage

```
selectNorm(ref=NULL,elems = "Rb,Sr,Ba,Cr,Ni,La,Ce,Y,Zr",REE.only=FALSE)
```

Arguments

`ref`	character: a specification of the normalizing model.
`elems`	character: a default list of elements.
`REE.only`	logical: should be only listed normalization schemes for REE?

Details

There are two ways of using this function. Firstly, a search pattern can be specified for a query of the available normalizing model names. The corresponding parameter '*ref*' can contain a substring or even a regular expression. The function fails if no matches are found or the search is ambiguous.

The second possibility is to choose from the list of available normalizing schemes. The first option offers normalization *by a single sample*. Its name can be typed in or, after pressing the Enter key, picked from a list. Then the user is prompted to specify the list and order of elements/oxides that should appear on the plot. The easiest way is to type directly the names of the columns, separated by commas. Alternatively can be used their sequence numbers or ranges. Also built-in lists can be employed, such as 'LILE', 'REE', 'major' and 'HFSE' or their combinations with the column names. These lists are simple character vectors, and additional ones can be built by the user (see Examples). Note that currently only a single, stand-alone, user-defined list can be employed as a search criterion.

The samples to be plotted can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSubset` for details.

The second option is similar but it allows to normalize *by average concentrations* in a group of samples specified by one of the three searching mechanisms as above (see `selectSubset`).

The composition of *various standards* available for normalization and subsequent plotting of `spider` diagrams is stored in the file '`spider.data`' in the main GCDkit directory. It is a comma delimited file such as:

```
Normalization data used for spiderplots

MORB (Pearce 1983)
Sr,K,Rb,Ba,Th,Ta,Nb,Ce,P,Zr,Hf,Sm,Ti,Y,Yb
120,1245,2,20,.2,.18,3.5,10,534,90,2.4,3.3,8992,30,3.4

REE chondrite (Boynton 1984)
La,Ce,Pr,Nd,Pm,Sm,Eu,Gd,Tb,Dy,Ho,Er,Tm,Yb,Lu
.31,.808,.122,.6,1,.195,.0735,.2590,.0474,
.322,.0718,.21,0.0324,.209,.0322

ORG (PearceEtAl.1984)
K2O,Rb,Ba,Th,Ta,Nb,Ce,Hf,Zr,Sm,Y,Yb
0.4,4,50,0.8,0.7,10,35,9,340,9,70,8.0
```

The first row is always skipped and can contain any comments. The following ones have a fixed structure. For each normalization scheme, the first row contains the title and reference. If title starts with '`REE`', the normalization is supposed to be for REE only and special parameters, such as '`Eu/Eu*`', are calculated. The second line gives a comma delimited list of elements in the order they should appear on the plot. The last line is a comma delimited list of normalization values. There are empty lines left between the normalization schemes.

As the file '`spider.data`' is read every time '`selectNorm` is called, the user can add or delete normalization schemes on his will using a text editor.

Value

A numeric matrix with one row, containing the normalizing values. The row name contains the name of the model and reference.

Examples

```
selectNorm()
selectNorm("Boynton")
```

`selectSubset` *Select subset*

Description

Selects samples corresponding to given criteria.

Usage

```
selectSubset(what=NULL,where=cbind(labels,WR),save=TRUE,multiple=TRUE,
text="Press ENTER for all samples, or specify search pattern \n by sample name,
range=FALSE,GUI = FALSE, all.nomatch = TRUE)

selectSamples(what=NULL, print=TRUE, multiple=TRUE, text=NULL)
```

Arguments

`what`	search pattern
`where`	data to be searched
`save`	should the newly selected subset replace the data in memory, i.e. '`labels`' and '`WR`'
`multiple`	logical, can be multiple items selected?
`text`	text prompt
`range`	logical: is the search pattern to be interpreted as a range of samples?
`GUI`	logical: is the function called from within GUI?
`all.nomatch`	logical: return all samples when there is no match?
`print`	logical: should be the chosen samples ID printed?

Details

The function '`selectSubset`' has two purposes.

1. If '`save=TRUE`', it is a core function used in selecting subsets of the current data set by ranges (see `subsetRange`) or Boolean conditions (see `subsetBoolean`).

2. If `save=FALSE`, no permanent subsetting takes place. This is useful for temporary selections of the data, e.g. in determining which samples are to be plotted on a diagram.

In this case, the samples can be selected based on combination of three searching mechanisms. The search pattern is first tested whether it obeys a syntax of a valid `regular expression` that could be interpreted as a query directed to the sample name(s).

If not, the syntax of the search pattern is assumed to correspond to a selection of sample sequence numbers.

At the last resort, the search pattern is interpreted as a Boolean condition that may employ most of the comparison operators common in R, i.e. < (lower than), > (greater than), <= (lower or equal to), >= (greater or equal to), = or == (equal to), != (not equal to). The character strings should be quoted. Regular expressions can be employed to search the textual labels.

The conditions can be combined together by logical `and, or` and brackets.

Logical `and` can be expressed as `.and. .AND. &`

Logical `or` can be expressed as `.or. .OR. |`

The function '`selectSamples`' is a front-end to '`selectSubset`'.

Value

If 'save=TRUE', the function overwrites the data frame 'labels' and numeric matrix 'WR' by subset that fulfills the search criteria. Otherwise names of samples fulfilling the given criteria are returned.

Warning

So far only names of existing numeric data columns and not formulae involving these can be handled.

```

`setCex` *Set uniform symbols size*

Description

Defines the default relative size of plotting symbols.

Usage

```
setCex(x)
```

Arguments

`x`	numeric; scaling for the plotting symbols.

Details

The coefficient determining the plotting symbols expansion is stored in a variable '`labels[,"Size"]`', the default is 1.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

`gcdOptions`

Examples

setCex(2) # double size
plotDiagram("TAS",FALSE)

setCex(0.5) # half the size
plotDiagram("TAS",FALSE)
```

`setShutUp` *Quiet mode?*

Description

Determines whether extensive textual output is to be printed.

Usage

```
setShutUp()
```

Arguments

None.

Details

The control option is `shut.up`, whose default is `FALSE`, meaning that detailed information is to be printed. This, however, may become not viable on slower systems and/or for extensive data sets.

This can be set from the menu `'GCDkit|Options'` by setting the checkbox `'Minimize output on screen?'` or directly, from the command line (see Examples).

options("shut.up"=TRUE) # reduce the printed output to a minimum
```

`Shand` *A/CNK-A/NK diagram (Shand 1943)*

Description

Assigns data for Shand's diagram into Figaro template (list `'sheet'`) and appropriate values into `'x.data'` and `'y.data'`

Usage

```
Shand()
```

Details

Classic Shand's diagram (1943). Three rock types are defined in the A/CNK vs A/NK plot:

Peralkaline
Metaluminous
Peraluminous

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	molecular ratio A/CNK=$Al_2O_3/(CaO + Na_2O + K_2O)$
`y.data`	molecular ratio A/NK=$Al_2O_3/(Na_2O + K_2O)$

plotDiagram("Shand", FALSE)
```

Shervais *Shervais (1982)*

Description

Assigns data for the diagram of *Shervais (1982)* into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
Shervais()
```

Details

Discrimination diagram for basalts, as proposed by *Shervais (1982)* is based on variability of the Ti/V ratio under different oxygen fugacity. Following environments may be distinguished:

ARC	*Arc Tholeiites*
OFB	*Ocean Floor Basalts*

showColours *Show available colours*

Description

Display colours available for plotting.

Usage

```
showColours(n=49)
showColours2(n=64)
```

Arguments

n	numeric: number of colours to display

Details

The function 'showColours' displays a palette of plotting colours which can be specified by their numeric codes (1-49). On the other hand, 'showColours2' demonstrates the colours which can be given by their English names (there are some 657 of them).

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

'colours'

showLegend *Display legend*

Description

Displays a graphical legend(s) with assignment of plotting symbols and colours used by majority of the diagrams.

Usage

```
showLegend(pch = labels$Symbol, col = labels$Colour,
new.plot = TRUE)
```

Arguments

pch	numeric or character: plotting symbols.
col	numeric: code for their colour.
new.plot	logical: shall be opened a new plotting window for the legend?

Details

The internal variables 'leg.col' and 'leg.pch' are set to zero, if the current assignment is on the basis of 'groups'. Otherwise they contain the sequential number(s) of column(s) in the data frame 'labels' whose levels are to be used to build the legend(s). If both variables differ, two legends are created, for plotting symbols and colours separately. If both equal zero, the current grouping information is used.

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

Symbols and colours by a single label can be assigned by functions assignSymbLab and assignColLab respectively, symbols and colours by groups simultaneously by assignSymbGroup. Uniform symbols are obtained by assign1symb, uniform colours by assign1col. Table of available plotting symbols is displayed by showSymbols and colours by showColours.

Examples

```
showLegend()
```

showSymbols *Show available symbols*

Description

Shows symbols available for plotting.

Usage

```
showSymbols()
```

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

spider *Spider plot(s): Selected samples*

Description

Normalization of trace-element data by the given standard and spiderplot plotting.

Usage

```
spider.individual(new=TRUE)

spider.contour(chondrit = selectNorm(),what=NULL,
colour.palette = "heat.colors", ymin = 0, ymax = 0,
cex = 1,join = TRUE,pch = 15,
main = "",sub = "",offset = TRUE,centered = FALSE,
xrotate = FALSE, xaxs = "r")

spider(rock, chondrit = selectNorm(), ymin = 0,
ymax = 0, cex = 1, plot = TRUE, join = TRUE,
field = FALSE, legend = FALSE, add = FALSE,
pch = 0, col = "black", shaded.col = "gray",
density = 0.02, angle = 0, main = "", sub = "",
offset = FALSE, centered = FALSE, xrotate = FALSE,
xaxs = "r", fill.col = TRUE, log = "y", new = TRUE, ...)
```

Arguments

new	logical; if true, new plotting window is opened.
chondrit	a numeric matrix with one row; the normalizing values.
what	variable name or formula.
colour.palette	variable name or formula.
rock	a numeric matrix; the whole-rock data from which will be filtered out those to be normalized.

ymin, ymax	y range of the diagram.
cex	magnification of the plotting symbols.
plot	logical; if set to FALSE, individual patterns are not plotted.
join	logical; if TRUE, the NAs are extrapolated so that the patterns are unbroken.
field	logical; if TRUE, a shaded field denoting the overall data span is plotted
legend	logical; if TRUE, room for legend is reserved.
add	logical; if TRUE, a new plot is started (otherwise overplot).
pch	a vector specifying the plotting symbols.
col	a numeric vector; colour of the plotting symbols and connecting lines.
fill.col	logical; should be the field of overall variability filled by solid colour?
shaded.col	numeric: colour for the cross-hatched or solid fill.
density	numeric: density of the fill pattern (fraction of the whole plotting range).
angle	numeric: angle of the fill pattern (in degrees).
main	character: the main title for the plot.
sub	character: the subtitle for the plot.
xrotate	logical; shall be the element names on x axis rotated?
offset	logical; shall be the names for odd and even elements shifted relative to each other?
centered	logical; shall be the element names on x axis plotted in between tick marks?
xaxs	style of the xaxis: see 'help(par) for details.
log	which of the axes should be logarithmic?
...	further graphical parameters: see 'help(par) for details.

Details

This is a quite flexible function, a true *Mother of All Spiderplots*, that can be used in a number of ways. It is employed by functions of the GCDkit system for normalization and plotting individual patterns for selected samples ('spiderplot.r') or each of the groups ('spider by group individual.r'). Function 'spider' can also serve for plotting the overall compositional ranges (shown as cross-hatched fields or, optionally, filled polygons) in a manner similar to function 'spider by group.r'.

In 'spiderplot.r' is stored a user interface to 'spider' for plotting individual patterns.

In 'spiderplot_contour.r' is stored a user interface to 'spider' for plotting individual patterns, in which the plotting symbols is uniform and colour reflects distribution of an independent variable, such as silica contents. The variable (or formula) can be specified using the parameter 'what', the colour scheme by 'colour.palette'. The legal colour schemes are: '"grays","reds","blues","greens","cyans","violets","yellows","cm.colors", "heat.colors","terrain.colors","topo.colors","rainbow"'.

The samples to be plotted can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSamples for details.

For choosing the correct normalization values serves the auxiliary function selectNorm.

Then the user is prompted whether to use the currently assigned plotting symbols. If desired so, the symbols and colours can be specified in a simple spreadsheet- like interface.

Likewise the scale of the y axis can be specified.

The exact appearance of the labels to the x axis can be fine tuned by the arguments 'rotate.xlab', 'offset' and 'centered'. See examples.

If 'plot=FALSE', not plotting is done, and only the normalized values are returned.

Value

`results` numeric matrix with normalized concentrations.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>;

Vojtech Erban, <vojtech.erban@geology.cz>, contributed the algorithm hatching closed polygons

See Also

For the syntax of the setup file with normalizing values and adding new normalization schemes see `selectNorm`; for further applications of 'spider' see `spider2norm`, `spiderByGroupPatterns` and `spiderByGroupFields`.

ee<-spider(WR, "Boynton", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=T, xrotate=T, centered=T,
    main="offset=T, xrotate=T, centered=T",new=F)

spider(WR,"Boynton",plot=FALSE) # Calculation only
```

`spider2norm` *Spider plot(s): Selected samples, double normalized*

Description

Plots a double normalized spiderplot. Trace-element data are first normalized by the given standard, as usual (see `spider`). Then the normalized concentrations are multiplied by a factor needed to adjust the normalized content of the selected element in each analysis to a desired value (such as unity). The goal is to eliminate effects of fractional crystallization *(Thompson et al. 1983, Pearce et al. 2005, Pearce and Stern 2006).*

Usage

```
spider2norm(rock=WR,norm=NULL,norm2=NULL,ymin=0,ymax=0,which=rep(TRUE,nrow(rock)),
legend=FALSE,pch=labels$Symbol,col=labels$Colour,plot=TRUE,join=TRUE,shaded.col=
density=-1,angle=0,xaxs="r",fill.col=FALSE,field=FALSE,add=FALSE,...)
```

Arguments

`rock`	a numeric matrix; the whole-rock data from which will be filtered out those to be normalized.
`norm`	a character string specifying the model.
`norm2`	name of the variable for the second normalization.
`ymin, ymax`	y range of the diagram.
`which`	specification of the samples to be plotted.
`legend`	logical; if TRUE, room for legend is reserved.
`pch`	a vector specifying the plotting symbols.
`col`	a numeric vector; colour of the plotting symbols and connecting lines.
`plot`	logical; if set to FALSE, individual patterns are not plotted.
`join`	logical; if TRUE, the NAs are extrapolated so that the patterns are unbroken.
`shaded.col`	numeric: colour for the cross-hatched fill.
`density`	numeric: density of the fill pattern (fraction of the whole plotting range).
`angle`	numeric: angle of the fill pattern (in degrees).
`xaxs`	style of the xaxis: see '`help(par)` for details.
`fill.col`	colour for solid fill
`field`	logical; if TRUE, a shaded field denoting the overall data span is plotted
`add`	logical; if TRUE, a new plot is started (otherwise overplot).
`...`	further graphical parameters: see '`help(par)` for details.

Details

The parameter '*norm*' is an optional search pattern to query the available normalizing model names. It can contain a substring or even a regular expression. For choosing the correct normalization values serves the auxiliary function `selectNorm`.The function fails if no matches are found or the search is ambiguous. See `selectNorm` for details.

The samples to be plotted can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

Then the user is prompted whether to use the currently assigned plotting symbols. If desired so, the symbols and colours can be specified in a simple spreadsheet- like interface.

Likewise the scale of the y axis can be specified interactively.

Value

`results` numeric matrix with normalized concentrations

.

For the syntax of the setup file with normalizing values and adding new normalization schemes see `selectNorm`; for further variants of spiderplots, see `spider`, `spiderByGroupPatterns` and `spiderByGroupFields`.

Examples

```
ee<-spider2norm(WR,"Boynton","Yb",0.1,1000,pch="*",col="red",cex=2) # the ee<- constructi

ee<-spider2norm(WR,"Boynton","Yb",field=TRUE,density=0.05,angle=60,col="red",0.1,1000)

ee<-spider2norm(WR,"Boynton","Yb",field=TRUE,fill.col=TRUE,shaded.col="khaki",0.1,1000)

# Shade the background field portraying the overall variation
ee<-spider2norm(WR,"Boynton","Lu",0.1,1000,pch=labels$Symbol,col=labels$Colour,cex=labels
ee<-spider2norm(WR,"Boynton","Lu",field=TRUE,density=0.02,angle=45,col="gray",add=TRUE)

# Shade the background field portraying the overall variation
ee<-spider2norm(WR,"Boynton","Lu",0.1,1000,pch=labels$Symbol,col=labels$Colour,cex=labels
```

```
ee<-spider2norm(WR,"Boynton","Lu",field=TRUE,fill.col=TRUE,shaded.col="gray",add=TRUE)

# Possible styles for x axis
multiplePerPage(8,nrow=2,ncol=4,"Possible x axis styles", dummy=FALSE)
ee<-spider2norm(WR, "Boynton","Yb", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=F, xrotate=F, centered=F,new=F)
ee<-spider2norm(WR, "Boynton","Yb", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=F, xrotate=T, centered=F,new=F)
ee<-spider2norm(WR, "Boynton","Yb", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=F, xrotate=F, centered=T,new=F)
ee<-spider2norm(WR, "Boynton","Yb", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=F, xrotate=T, centered=T,new=F)
ee<-spider2norm(WR, "Boynton","Yb", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=T, xrotate=F, centered=F,new=F)
ee<-spider2norm(WR, "Boynton","Yb", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=T, xrotate=T, centered=F,new=F)
ee<-spider2norm(WR, "Boynton","Yb", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=T, xrotate=F, centered=T,new=F)
ee<-spider2norm(WR, "Boynton","Yb", 0.1, 1000, pch=labels$Symbol,
    col=labels$Colour, cex=labels$Size, offset=T, xrotate=T, centered=T,new=F)

spider2norm(WR,"Boynton","Yb",plot=FALSE) # Calculation only
```

`spiderBoxplot` *Spider plot(s): Selected samples - summary boxplot*

Description

Normalization of geochemical data by the given standard (optionally also one of the samples) and spiderplot plotting. No individual patterns are drawn; instead, the statistical distribution of each element is portrayed by a boxplot.

Usage

```
spiderBoxplot(norm = NULL, which = rep(TRUE,nrow(WR)),
    doublenorm = FALSE, norm2 = "",
    ymin = NULL, ymax = NULL, bpplot = TRUE,
    col = "lightgray", log = TRUE)
```

Arguments

`norm`	a character string specifying the model.
`which`	specification of the samples to be plotted.
`doublenorm`	logical; should be the normalization employed? See details.
`norm2`	name of the variable for the second normalization.
`ymin, ymax`	y range of the diagram.
`bpplot`	logical; if FALSE, boxplot box (instead of box and percentile plot) is shown.
`col`	fill colour.
`log`	logical; should be the y axis scaled logarithmically?

Details

The parameter '*norm*' is an optional search pattern to query the available normalizing model names. It can contain a substring or even a regular expression. The function fails if no matches are found or the search is ambiguous. See `selectNorm` for details.

The samples to be plotted can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

For choosing the correct normalization values serves the auxiliary function `selectNorm`, which is the same as in ordinary spiderplots. If the user desires so, the data can be normalized by a sample present in the dataset. Then the elements to be plotted and their order is to be specified, as well.

Optionally, double normalization can be used. Trace-element data are first normalized by the given standard, then by the normalized content of the selected element in each analysis to eliminate effects of fractional crystallization *(Thompson et al. 2003, Pearce et al. 2005, Pearce and Stern 2006)*. See `spider2norm` for details.

Distributions of individual normalized elements are plotted in the form of boxplot or box and percentile plot *(Esty and Banfield 2003)*.

In both cases the box denotes 50% of the population (both quartiles), the horizontal line in the middle is a median and the whiskers denote the overall range. For boxplot this is without outliers. See manual entry for '`boxplot`' and '`bpplot.my`' for further details.

Printed are number of observations, missing values, mean, standard deviation, minimum, 25% quartile, median (=50% quartile), 75% quartile and maximum.

Value

`results` numeric matrix with statistical data for individual elements.

Warning

This function IS NOT Figaro-compatible. It means that the set of diagrams cannot be further edited in GCDkit (e.g. tools in "Plot editing" menu are inactive).

For the syntax of the setup file with normalizing values and adding new normalization schemes see selectNorm; for further applications of 'spider' see spiderByGroupPatterns, spider2norm and spiderByGroupFields.

Examples

```
spiderBoxplot("Boynton",col="yellow",bpplot=FALSE)
spiderBoxplot("Primordial Wood",doublenorm=TRUE,norm2="Y",
   col="khaki",ymin=0.05,ymax=1000,bpplot=TRUE)
```

---

spiderByGroupFields

Spider plot(s) - by group fields

Description

Plots a series of spiderplots, for each group one, outlining the overall distribution as a field.

Usage

```
spiderByGroupFields(rock = WR, norm = NULL,
bw = FALSE, fill = FALSE, ymin = 0, ymax = 0,
xrotate = FALSE, offset = TRUE, centered = FALSE)
```

Arguments

rock	a numeric matrix; the whole-rock data from which will be filtered out those to be normalized.
norm	a character string specifying the model.
bw	logical; should be the plot black and white?
fill	logical; should be the fields filled by solid colour (and not hatched)?
ymin, ymax	y range of the diagram.
xrotate	logical; shall be the element names on x axis rotated?
offset	logical; shall be the names for odd and even elements shifted relative to each other?
centered	logical; shall be the element names on x axis plotted in between tick marks?

Details

The parameter '*norm*' is an optional search pattern to query the available normalizing model names. It can contain a substring or even a regular expression. For choosing the correct normalization values serves the auxiliary function selectNorm.The function fails if no matches are found or the search is ambiguous. See selectNorm for details.

A series of spiderplots is plotted, for each group one, in which the whole variation range is outlined as filled/cross-hatched fields.

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>; Vojtech Erban, <vojtech.erban@geology.cz>, contributed the algorithm hatching closed polygons

See Also

For the syntax of the setup file with normalizing values and adding new normalization schemes see `selectNorm`. This function is based on `spider`.

Examples

```
## Not run:
    data<-loadData("sazava.data",sep="\t")
    groupsByLabel("Intrusion")
    spiderByGroupFields(norm="Boynton",ymin=1,ymax=1000)

    spiderByGroupFields(norm="Boynton",bw=TRUE,ymin=1,ymax=1000,xrotate=TRUE,offset=FALSE

    spiderByGroupFields(norm="Boynton",fill=TRUE,ymin=1,ymax=1000)

## End(Not run)
```

---

spiderByGroupPatterns

Spider plot(s) - by group patterns

Description

Plots a series of spiderplots, for each group one, in which individual patterns are shown.

Usage

```
spiderByGroupPatterns(rock = WR, norm = NULL, bw = FALSE,
ymin = 0, ymax = 0, xrotate = FALSE, offset = TRUE, centered = FALSE)
```

Arguments

`rock`	a numeric matrix; the whole-rock data from which will be filtered out those to be normalized.
`norm`	a character string specifying the model.
`bw`	logical; should be the plot black and white?
`ymin, ymax`	y range of the diagram.
`xrotate`	logical; shall be the element names on x axis rotated?
`offset`	logical; shall be the names for odd and even elements shifted relative to each other?
`centered`	logical; shall be the element names on x axis plotted in between tick marks?

Details

Firstly, the normalization scheme is chosen and scaling for all the plots specified. Then, a series of spiderplots is plotted, for each group one, in which patterns for individual samples are shown.

Value

Returns a list 'results' with the normalized values, and, in case of REE, some extra parameters.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

For the syntax of the setup file with normalizing values and adding new normalization schemes see selectNorm. This function is based on spider.

Examples

```
# Get the data ready
data(sazava)
accessVar("sazava")
groupsByLabel("Intrusion")

#Plot
spiderByGroupPatterns(norm="Boynton",ymin=1,ymax=1000)
spiderByGroupPatterns(norm="Boynton",bw=TRUE,ymin=1,ymax=1000,xrotate=TRUE,offset=FAI
```

---

srnd *Recalculations of the Sr-Nd isotopic data*

Description

Age-corrects the Sr-Nd isotopic data to a given age; calculates initial $\epsilon(Nd)$ values and Nd model ages.

Usage

```
srnd(age="")
initial(x,age,system="Nd")
epsilon(WR,age)
DMage(WR)
DMGage(WR)
DMLHage(WR, age)
```

Arguments

age	age in Ma: if empty, the user is prompted to enter a value
x, WR	isotopic data to be recalculated
system	character; which isotopic system Sr or Nd?

Details

Recalculates the Sr-Nd isotopic data and returns them in the numeric matrix `init` with the following columns:

Age (Ma)	Age in Ma
87Sr/86Sri	Initial Sr isotopic ratios
143Nd/144Ndi	Initial Nd isotopic ratios
EpsNdi	Initial $\epsilon(Nd)$ values
TDM	Single-stage depleted-mantle Nd model ages *(Liew & Hofmann, 1988)*, function `Image`
TDM.Gold	Single-stage depleted-mantle Nd model ages *(Goldstein et al., 1988)*, function `DMGage`
TDM.2stg	Two-stage depleted-mantle Nd model ages *(Liew & Hofmann, 1988)*, function `DMLHage`

Value

`init` numeric matrix with the results

Plugin

SrNd.r

# recalculation to 500 Ma
srnd(500)

# print the isotopic parameters currently in the memory
init
```

`statsByGroup` *Statistics by groups*

Description

Calculates simple descriptive statistics for individual columns of the given data matrix; optionally this can be done for each of the groups separately.

Usage

```
statsByGroup(data = WR, groups = groups)
```

Arguments

data	numeric data matrix.
groups	a vector, in which is specified, for each sample, a group it belongs to.

Details

The function returns a list containing the calculated statistical parameters respecting the desired grouping. The statistical summary involves number of observations, missing values, mean, standard deviation, minimum, 25% quartile, median (= 50% quartile), 75% quartile and maximum. This is a core function invoked both by summarySingle and summarySingleByGroup.

Value

results	a list with the results for individual groups

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

summarySingle
statistics
summaryAll
summaryByGroup

Examples

statsByGroup(WR)

statsByGroup(WR[,LILE])
```

---

statsByGroupPlot *Statistics: Plot summary by element and group*

Description

Plots crosses in a binary diagram denoting means and standard deviations for individual groups.

Usage

```
statsByGroupPlot()
```

Details

Displays a binary diagram of two elements/oxides in which are plotted averages for the individual groups with whiskers corresponding to their standard deviations.

The variables are entered via the function 'selectColumnLabel'. In the specification of the variables can be used also arithmetic expressions, see calcCore for the correct syntax.

Value

`results` a matrix with the results for individual groups and selected two elements/oxides

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

---

statsIso *Statistical plots of isotopic ratios/model ages*

Description

Plots a boxplot or stripplot for a given isotopic parameter, respecting groups.

Usage

```
boxplotIso()

stripplotIso()
```

Arguments

None.

Details

The boxplot portrays realistically a statistical distribution of the data. The box represents, for each of the groups, the two quartiles, the line inside is a median, the whiskers show the whole range without outliers.

Stripplot shows 1D scatter plots for each of the groups, with some artificial noise (jitter) added to make the individual points better visible. Stripplots are a good alternative to boxplots when sample sizes are small.

The variables to choose from are:

Menu item	**Explanation**
87Sr/86Sri	Initial Sr isotopic ratios
143Nd/144Ndi	Initial Nd isotopic ratios
EpsNdi	Initial $\epsilon(Nd)$ values
1 stg DM model ages *(Goldstein et al. 1988)*	Single-stage DM Nd model ages
1 stg DM model ages *(Liew & Hofmann 1988)*	Single-stage DM Nd model ages
2 stg DM model ages *(Liew & Hofmann 1988)*	Two-stage DM Nd model ages

Value

None.

Plugin

SrNd.r

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

References

Liew T C & Hofmann A W (1988) Precambrian crustal components, plutonic associations, plate environment of the Hercynian Fold Belt of Central Europe: indications from a Nd and Sr isotopic study. Contrib Mineral Petrol 98: 129-138

strip *Statistics: Stripplot by groups*

Description

Stripplot for selected samples and variable, respecting the grouping.

Usage

```
strip(xlab = "", ...)
```

Arguments

xlab	variable name
...	additional parameters to stripplot

Details

Stripplot shows 1D scatter plots for each of the groups, with some artificial noise (jitter) added to make the individual points better visible. Stripplots are a good alternative to boxplots when sample sizes are small.

If no variable is specified as an argument 'xlab', the user can enter it using the function 'selectColumnLabel'.

In the specification of the variable can be used also arithmetic expressions, see calcCore for the correct syntax.

Value

None.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

stripplot, stripBoxplot

Examples

```
strip("(Na2O+K2O)/Al2O3")
```

`stripBoxplot` *Statistics: Stripplot by groups - with boxplots*

Description

Stripplot for selected variable, respecting the grouping. Each of the stripplots for the individual groups are underlain by a boxplot, so that the median, quartiles and range are immediately apparent. Optionally, the data points can be replaced by variously sized/coloured circles, depicting a distribution of a second variable.

Usage

```
stripBoxplot(yaxis = "", zaxis = "0", ymin = NULL, ymax = NULL, ident = FALSE, s
```

Arguments

`yaxis`	specification of the variable used for stripplots/boxplots
`zaxis`	(optional) specification of the variable depicted by the circles
`ymin, ymax`	minimum and maximum of the y axis
`ident`	logical; should be the samples identified interactively after plotting?
`silent`	logical, should be the above chosen by the appropriate dialogues?

Details

Stripplot shows 1D scatter plots for each of the groups, with some artificial noise (jitter) added to make the individual points better visible. Stripplots are a good alternative to boxplots when sample sizes are small.

If no variable is specified as an argument '`yaxis`', the user can enter it using the function '`selectColumnLabel`'.

If '`zaxis`' is zero, assigned plotting symbols, colours and symbol sizes are used.

If '`zaxis`' refers to a valid variable name, the data points are shown as circles, the size and colours of which correspond to this second variable.

In the specification of the variable(s) can be used also arithmetic expressions, see `calcCore` for the correct syntax.

Value

None.

Author(s)

Vojtech Janousek, `<vojtech.janousek@geology.cz>`

See Also

`stripplot`, `boxplot`, `strip`, `plotWithCircles`

Examples

```
stripBoxplot("(Na2O+K2O)/Al2O3")
```

Subset by range — *Select subset by range*

Description

Selecting subsets of the data stored in memory by their range.

Details

The menu item 'Select subset by range' is connected to the function selectSubset. The search pattern is treated as a selection of sample sequence numbers (effectively a list separated by commas that may also contain ranges expressed by colons). The current data will be replaced by its newly chosen subset.

Value

Overwrites the data frame 'labels' and numeric matrix 'WR' by subset that fulfills the search criteria.

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
## Not run:
Search pattern = 1:5
# First to fifth samples in the data set

Search pattern = 1,10
# First and tenth samples

Search pattern = 1:5, 10:11, 25
# Samples number 1, 2, ...5, 10, 11, 25

## End(Not run)
```

summaryAll — *Statistics: Statistical summaries for the whole data set or its subset*

Description

The function 'summaryAll' prints statistical summary for selected list of elements (majors as a default) and the current dataset (or its part). Functions 'summaryMajor' and 'summaryTrace' are entry points supplying the default lists for major- and trace elements.

Usage

```
summaryAll(elems = major, where = NULL, show.boxplot = FALSE,
    show.hist = FALSE, silent=TRUE)
summaryMajor()
summaryTrace()
```

Arguments

elems	list of desired elements
where	list of desired samples to be processed
show.boxplot	logical, should be plotted the boxplots?
show.hist	logical, should be plotted the histograms?
silent	logical, should be the above chosen by the appropriate dialogues?

Details

The statistical summary involves number of observations, missing values, mean, standard deviation, minimum, 25% quartile, median (= 50% quartile), 75% quartile and maximum. The function also plots summary boxplots and histograms, if desired so.

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSamples for details.

Even though as a default are assumed a list of major (SiO2, TiO2, Al2O3, FeOt, MnO, MgO, CaO, Na2O, K2O for 'summaryMajor') or selected trace (Rb, Sr, Ba, Cr, Ni, La, Eu, Y, Zr for 'summaryTrace') elements, the variable(s) to be displayed can be modified/specified in all cases. To this purpose serves the function 'selectColumnsLabels'.

In the specification of the variable can be used also arithmetic expressions, see calcCore for the correct syntax.

Value

results	numeric matrix with the results

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

See Also

statistics summarySingle summarySingleByGroup summaryByGroup

Examples

```
summaryAll(LILE)

summaryAll(LILE,show.hist=TRUE)

summaryAll(LILE,show.boxplot=TRUE)

# user-defined list
my.elems<-c("Rb","Sr","Ba")
summaryAll(my.elems)

## Not run:
    summaryMajor()
    summaryTrace()

## End(Not run)
```

summaryByGroup *Statistics: Statistical summaries by groups*

Description

The function 'summaryByGroup' prints a statistical summary for selected list of elements (majors as a default) and the whole dataset or its selection, respecting the current grouping. Functions 'summaryByGroupMjr' and 'summaryByGroupTrc' are entry points supplying the default lists for major- and trace elements. The function 'summaryByGroupTrc' returns only ranges of the given parameter(s).

Usage

```
summaryByGroup(elems = major, where = NULL, show.boxplot = FALSE,
    show.hist = FALSE, silent = TRUE)

summaryByGroupMjr()

summaryByGroupTrc()

summaryRangesByGroup(elems=major, where=NULL, silent=TRUE)
```

Arguments

elems	list of desired elements
where	list of desired samples to be processed
show.boxplot	logical, should be plotted the boxplots?
show.hist	logical, should be plotted the histograms?
silent	logical, should be the above chosen by the appropriate dialogues?

Details

The statistical summary involves number of observations, missing values, mean, standard deviation, minimum, 25% quartile, median (= 50% quartile), 75% quartile and maximum. The function also plots a summary boxplots and histograms, if desired so.

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSamples for details.

The defaults are lists of major (SiO2, TiO2, Al2O3, FeOt, MnO, MgO, CaO, Na2O, K2O) or trace (Rb, Sr, Ba, Cr, Ni, La, Eu, Y, Zr) elements, respectively.

The desired variables are selected using the function 'selectColumnsLabels'.

In the specification of the variable can be used also arithmetic expressions, see calcCore for the correct syntax.

Value

results	a list with the results for individual groups

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
summaryByGroup(LILE)

summaryByGroup(LILE,show.hist=TRUE)

summaryByGroup(LILE,show.boxplot=TRUE)

# user-defined list
my.elems<-c("Rb","Sr","Ba/Sr")
summaryByGroup(my.elems)

## Not run:
summaryByGroupTrc()
summaryByGroupMjr()
summaryRangesByGroup(elems="Rb/Sr,Na2O+K2O")

## End(Not run)
```

---

summarySingle *Statistics: Single variable all/selection*

Description

Prints statistical summary for a single variable and the current dataset (or its part).

Usage

```
summarySingle(xlab="")
```

Arguments

xlab	variable name

Details

The statistical summary involves number of observations, missing values, mean, standard deviation, minimum, 25% quartile, median (=50% quartile), 75% quartile and maximum. The function also plots a summary boxplot and histogram.

In addition the statistical distribution of the given variable is shown as a boxplot, a box-percentile plot and two variants of histograms.

If no variable is specified as an argument 'xlab', the user can enter it using the function

'selectColumnLabel'. In the specification of the variable can be used also arithmetic expressions, see calcCore for the correct syntax.

The samples can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSamples for details.

Value

results	numeric matrix/vector with the results

summarySingleByGroup

Statistics: Single variable by groups

Description

Prints statistical summary for a single variable and the whole dataset, divided by groups.

Usage

```
summarySingleByGroup(xlab="")
```

Arguments

xlab	variable name

Details

The statistical summary involves number of observations, missing values, mean, standard deviation, minimum, 25% quartile, median (= 50% quartile), 75% quartile and maximum. The function also plots a summary boxplot and histogram.

If no variable is specified as an argument 'xlab', the user can enter it using the function 'selectColumnLabel'. In the specification of the variable can be used also arithmetic expressions, see calcCore for the correct syntax.

`Sylvester` *Sylvester (1989)*

Description

Assigns data for a binary plot $(Al_2O_3 + CaO)/(FeOt + Na_2O + K_2O)$ vs. $100 * (MgO + FeOt + TiO_2)/SiO_2$, proposed by *Sylvester (1989)* to distinguish the alkaline collision-related alkaline granites into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

Usage

```
Sylvester()
```

Details

In the plot $(Al_2O_3 + CaO)/(FeOt + Na_2O + K_2O)$ vs. $100 * (MgO + FeOt + TiO_2)/SiO_2$ of *Sylvester (1989)* can be distinguished 'Alkaline'collision-related granites, from 'Calc-alkaline & Strongly peraluminous' types (solid line). The strongly fractionated calc-alkaline varieties are separated by the dashed line. Note that only samples with SiO_2 > 68 wt. % are plotted.

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	(Al2O3+CaO)/(FeOt+Na2O+K2O) [wt. %]
`y.data`	100*(MgO+FeOt+TiO2)/SiO2 [wt. %]

Author(s)

Vojtech Janousek, <vojtech.janousek@geology.cz>

Examples

```
#plot the diagram
plotDiagram("Sylvester", FALSE)
```

`TAS` *IUGS recommended TAS (Le Bas et al. 1986)*

Description

Assigns data for IUGS recommended TAS diagram into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'

Usage

```
TAS(cutoff=95)
```

Arguments

`cutoff`	numeric; the minimal sum of the analysis to be considered for classification

Details

TAS diagram, as proposed by *Le Bas et al. (1986)*, codified by *Le Maitre et al. (1989)* and slightly modified by *Le Bas (2000)*.
The diagram (in its basic form) defines following fields:

foidite
picrobasalt
basalt
basaltic andesite
andesite
dacite
rhyolite
trachybasalt
basaltic trachyandesite
trachyandesite
trachyte/trachydacite
tephrite/basanite
phonotephrite
tephriphonolite
phonolite

This primary division is further enhanced by the '`TASadd`' routine (called automatically by '`classify`').

Following actions are carried out:

- Analyses with $H_2O > 2$ and $CO_2 > 0.5$ (weight percent) are filtered out
- *Trachybasalt* is subdivided into *hawaiite* and *potassic trachybasalt*
- *Basaltic trachyandesite* is subdivided into *mugearite* and *shoshonite*
- *Trachyandesite* is subdivided into *benmoreite* and *latite*
- High-Mg rocks are split into *picrite, komatiite, meimechite* and *boninite*

Note that systematics of high-Mg rocks follows revised IUGS Recommendations *(Le Bas et al., 2000; Le Maitre et al. 2002)* which differ from their 1st edition *(Le Maitre et al, 1989)*. Further subdivisions recommended by *Le Maitre et al. (1989)* are not implemented in GCDkit, mainly for poorly defined CIPW version used by the Subcommission.

Value

x.data	SiO2 data recast to anhydrous sum (matrix 'WRanh')
y.data	Na2O+K2O data recast to anhydrous sum (matrix 'WRanh')
sheet	list with Figaro Style Sheet data
results	matrix with classification results
groups	vector with classification results
grouping	set to -1

TASMiddlemost *Middlemost's modification of TAS diagram*

Description

Assigns data for Middlemost's modification of the TAS diagram into Figaro template (list 'sheet') and appropriate values into 'x.data' and 'y.data'.

Usage

```
TASMiddlemostVolc()

TASMiddlemostPlut()
```

Details

Middlemost's variation of classic IUGS-recommended TAS diagram, originally proposed by *Le Bas et al. (1986)*. Boundaries of foidite, phonolite, trachyte, trachydacite and rhyolite fields are defined, as inferred from the phase relations in the TAS system. Moreover, the trachyte + trachydacite field is split into trachyte and trachydacite fields, silexite and sodalitite + nephelinolith + leucitolith fields are defined.

The same diagram layout is applied also to plutonic rocks as follows:

plutonic rocks	**volcanic rocks**
Peridotgabbro	*Picrobasalt*
Gabbro	*Basalt*
Gabbroic Diorite	*Basaltic Andesite*
Diorite	*Andesite*
Granodiorite	*Dacite*
Granite	*Rhyolite*
Quartzolite	*Silexite*
Monzogabbro	*Trachybasalt*
Monzodiorite	*basaltic Trachyandesite*
Monzonite	*Trachyandesite*
Quartzmonzonite	*Trachydacite*
Syenite	*Trachyte*
Foid Gabbro	*Tephrite*
Foid Monzodiorite	*Phonotephrite*
Foid Monzosyenite	*Tephriphonolite*
Foid Syenite	*Phonolite*
Foidolite	*Foidite*
Tawite/Urtite/Italite	*sodalitite/nephelinolith/leucitolith*

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	SiO2 weight percent
`y.data`	Na2O+K2O weight percent

ternary *Ternary plot*

Description

These functions plot/add data to a ternary plot.

Usage

```
ternary(x = NULL, y = NULL, z = NULL, samples = rownames(WR),
    new = TRUE, grid = FALSE, ticks = TRUE, ...)

triplot(aa, bb, cc, alab, blab, clab, title = "", grid.int = 0,
tick.int = 0, label.axes = FALSE, line = FALSE,
pch = labels[names(aa), "Symbol"],
col = labels[names(aa), "Colour"],identify = getOption("gcd.ident"),
new = TRUE,...)

triplotadd(aa, bb, cc,
pch=labels[names(aa),"Symbol"],
col=labels[names(aa),"Colour"],
identify = FALSE, lines = FALSE, lty = "solid")
```

Arguments

x	character; specification of the plotting variable for the bottom left apex (formulae OK).
y	character; specification of the plotting variable for the top apex (formulae OK).
z	character; specification of the plotting variables for the bottom right apex (formulae OK).
grid	logical; should be grid plotted?
ticks	logical; should be ticks plotted?
samples	character or numeric vector; specification of the samples to be plotted.
new	logical; should be opened a new plotting window?

`...`	Further parameters to the functions 'ternary' and 'triplot'.
`aa`	a numerical vector, bottom left apex.
`bb`	a numerical vector, top apex.
`cc`	a numerical vector, bottom right apex.
`alab,blab,clab`	labels for the apices.
`title`	title for the whole diagram.
`grid.int`	interval of grid lines (0-1); if set to zero (default value), no grid is drawn.
`tick.int`	interval of ticks on axes (0-1); if set to zero (default value), no ticks are drawn.
`label.axes`	logical; if set to TRUE, axes are labeled by percentages of the components.
`line, lines`	logical; if set to TRUE, lines are drawn instead of plotting points.
`lty`	line type.
`pch`	plotting symbols.
`col`	plotting colours.
`identify`	logical; should be samples identified?

Details

The function 'ternary' is the user interface to 'triplot'. The latter sets up the axes, labels the apices, plots the data and, if desired, enables the user to identify the data points interactively.

If 'new=TRUE', new plot window is opened.

The values for 'label.axes' are chosen according to 'tick.int' or 'grid.int'; if these are not available, labels are drawn by 10%.

'triplotadd 'adds data points/lines to pre-existing ternary plot.

The variables to be plotted are selected using the function 'selectColumnLabel.

In the specification of the apices can be used also arithmetic expressions, see calcCore for the correct syntax.

The functions are Figaro-compatible.

Value

A numeric matrix with coordinates of the data points recast to a sum of 1.

Author(s)

Jakub Smid <smid@prfdec.natur.cuni.cz> & Vojtech Janousek, <vojtech.janousek@geology.cz>

tetrad *Lanthanide tetrad effect*

Description

Calculates lanthanide tetrad effect following the method of *Irber (1999)*.

Usage

```
tetrad(method=NULL)
```

Arguments

method	Normalization scheme.

Details

The method indicates which normalization scheme is to be used. It can be either 'Boynton' or 'Nakamura'. If not specified, the user is prompted to choose it interactively by the function spider.

The anomalies of individual elements are calculated as follows for the first tetrad:

$$Ce/Cet = \frac{Ce_N}{La_N^{\frac{2}{3}} * Nd_N^{\frac{1}{3}}}$$

$$Pr/Prt = \frac{Pr_N}{La_N^{\frac{1}{3}} * Nd_N^{\frac{2}{3}}}$$

$$t1 = \sqrt{Ce/Cet * Pr/Prt}$$

By analogy, one can define for the third tetrad:

$$Tb/Tbt = \frac{Tb_N}{Gd_N^{\frac{2}{3}} * Ho_N^{\frac{1}{3}}}$$

$$Dy/Dyt = \frac{Dy_N}{Gd_N^{\frac{1}{3}} * Ho_N^{\frac{2}{3}}}$$

$$t3 = \sqrt{Tb/Tbt * Dy/Dyt}$$

The magnitude of the tetrad effect is then calculated as a geometric mean:

$$t3 = \sqrt{t1 * t3}$$

Value

Returns a matrix '`results`' with the following columns:

`Ce/Cet`	Ce anomaly
`Pr/Prt`	Pr anomaly
`t1`	first tetrad
`Tb/Tbt`	Tb anomaly
`Dy/Dyt`	Dy anomaly
`t3`	third tetrad
`TE1-3`	degree of lanthanide tetrad effect, geometric mean of t1 and t3

Plugin

threeD *3D plot*

Description

Plots a 3-D plot of three specified variables.

Usage

```
threeD(xlab="",ylab="",zlab="")
```

Arguments

xlab	Name of the data column to be used as x axis.
ylab	Name of the data column to be used as y axis.
zlab	Name of the data column to be used as z axis.

Details

This function displays three variables in a form of 3D plot. The plot can be rotated interactively, if required so.

The samples to be plotted can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see selectSubset for details.

If no parameters 'xlab', 'ylab' and 'zlab' are given, the user is prompted to specify them.

The variables are selected using the function 'selectColumnLabel.

In the specification of the apices can be used also arithmetic expressions, see calcCore for the correct syntax.

See manual entry for 'cloud' for further details.

Value

None.

Warning

This function IS NOT Figaro-compatible.

Examples

```
threeD("SiO2","Na2O+K2O","MgO+FeOt")
```

`Verma` *Major-element based discrimination plots for (ultra-)basic rocks (Verma et al. 2006)*

Description

Plots data stored in '`WR`' (or its subset) into discrimination plots proposed by *Verma et al. (2006)* for (ultra-) basic rocks (SiO_2 < 52 wt. %).

Usage

```
Verma(FeMiddlemost=NULL)
```

Arguments

`FeMiddlemost` logical, should be iron adjusted according to Middlemost (1989)?

Details

Suite of five diagrams for discrimination of geotectonic environment of ultrabasic and basic rocks (SiO_2 < 52 wt. %), proposed by *Verma et al. (2006)*. It is based on log-transformed concentration ratios of major-element oxides. Note that prior to the transformation, the analyses are recast to 100% anhydrous basis. Each diagram is a plot of two discriminant functions, DF1 and DF2, respectively in x- and y-axes. Only samples with SiO_2 < 52 wt. % are plotted. To work properly, the major element analysis should be complete ($SiO_2, TiO_2, Al_2O_3, Fe_2O_3, FeO, MnO, MgO, CaO, Na_2O, K_2O, P_2O_5$). Following the recommendation by *Verma et al. (2006)*, prior to the plotting can be performed an adjustment of the iron-oxidation ratio as proposed by *Middlemost (1989)* (see 'FeMiddlemost').

For the Fe_2O_3/FeO ratios implemented for individual rock types (based on TAS classification), see *Verma et al. (2002)* (Fig. 1).

Following geotectonic settings may be deduced:

Abbreviation used	Environment
IAB	*island arc basic rocks*
CRB	*continental rift basic rocks*
OIB	*ocean-island basic rocks*
MORB	*mid-ocean ridge basic rocks*

Value

None.

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

`Villaseca` *B-A plot (modified by Villaseca et al. 1998)*

Description

The B-A diagram as proposed by *Debon and Le Fort (1983)* with classification fields for various types of peraluminous rocks designed by *Villaseca et al. (1998).*

Usage

```
Villaseca()
```

Details

Plots modified B-A diagram (designed originally by *Debon and Le Fort 1983*) with fields for various peraluminous rock types after *Villaseca et al. (1998).* Assigns data for the B-A diagram into Figaro template (list '`sheet`') and appropriate values into '`x.data`' and '`y.data`'.

The following fields are defined:

l-P	low peraluminous
m-P	moderately peraluminous
h-P	highly peraluminous
f-P	felsic peraluminous
metaluminous	

Rocks with composition falling beyond defined boundaries are labeled *'undefined'* by the 'classify' function.

Parameters for the diagram are calculated by the function '`DebonCalc`'. All of them are based on millications (1000 gram-atoms per 100 grams).

A = Al - (K + Na + 2 Ca)

B = Fe + Mg + Ti

For details, see *Debon & Le Fort (1983)* or *(1988)*.

Value

`sheet`	list with Figaro Style Sheet data
`x.data`	B value. See details.
`y.data`	A value. See details.

`Wedge` *Wedge diagrams (Ague 1994)*

Description

Implementation of Wedge diagrams after *Ague (1994)* and *Bucholz and Ague (2010)* used for judging the mobility of elements or oxides in course of various geochemically open-system processes such as alteration or partial melting.

Usage

```
Wedge(x = "Ti", y = NULL, protolith = NULL,
outline = "chull", precision = 10, plotAltered = TRUE,
xmin = 0, ymin = 0, xmax = NULL, ymax = NULL, fun = NULL)
```

Arguments

`x`	a single geochemical species presumably immobile during the given rock transformation.
`y`	list of elements/oxides for plotting, separated by commas.
`protolith`	Boolean search pattern to specify the protolith samples in the data file.
`outline`	method for contouring the clusters of protolith and product compositions, see Details.
`precision`	precision of contours drawn, if `'outline'="contour"`, see Details.
`plotAltered`	logical; should be the altered analyses plotted or just contoured?
`xmin, xmax`	(optional) limits for shared x axes of the individual plots.
`ymin`	(optional) minimum for all of the y axes of the plots.
`ymax`	(optional) upper limits for each of the y axes of the plots.
`fun`	panel function to be applied to each of the individual plots.

Details

Wedge diagrams *(Ague 1994)* enable qualitative treatment of losses/gains of geochemical species (elements or oxides) during open-system geological processes, such as alteration, metamorphism or partial melting. As such they represent a viable alternative to the isocon plots *(Grant 1986, 2005)* or concentration ratio diagrams *(Ague 1994)*. However, the Wedge diagrams have an advantage in that they take into account the overall variability of the whole dataset (both of the putative protolith and the altered product) and not just a selected whole-rock pair.

Wedge diagrams are simple binary plots of a potentially mobile element *j* versus a reference (immobile) element *i*. The compositionally heterogeneous protolith samples yield a cloud of points. The outer edges of this cloud define a wedge-shaped region that converges towards the origin.

As shown by *Bucholz and Ague (2010)*, the altered samples that plot above and to the left of this wedge are thought to have gained the mobile species *j*, whereas those falling below and to the right suffered its loss. The samples that remain in the wedge but moved upwards are thought to record residual enrichment, and those shifted downwards to have underwent a residual dilution.

The samples defining the protolith variation can be selected based on combination of three searching mechanisms (by sample name/label, range or a Boolean condition) - see `selectSamples` for details.

Implemented are two methods for outlining the clusters of the protolith and altered compositions (as specified by the argument `'outline'`), convex hull *(chull)* and contour *(contour)*. For the latter, the shape of the contours drawn can be controlled using the parameter *(precision)*. The higher it is, the smoother contours result. See `contourGroups` and `chullGroups` for further details.

Optionally, the individual data points for the altered samples may be replaced by contours portraying their density, if *plotAltered = FALSE*.

Parameters *xmin, xmax, ymin* and *ymax* are passed to the function `plotWithLimits` used for the actual data plotting.

Optionally, panel function specified by *fun* with two arguments, *xlab* and *ylab*, is applied to each of the plots.

Value

Returns a matrix `'results'` of slopes of tie-lines from individual protolith samples to the origin (with a component for each diagram, i.e. for each species evaluated). Lines of maximum and minimum slopes are those which are plotted as dashed lines, thus defining the wedge of the protolith variation (see Details).

Plugin

Isocon.r

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

`Whalen` *A type granitoids (Whalen et al. 1987)*

Description

Set of discrimination plots to distinguish A-type granitoids as defined by *Whalen et al.(1987)*.

Usage

```
Whalen(plot.txt = getOption("gcd.plot.text"))
```

Arguments

`plot.txt`	logical, annotate fields by their names?

Details

Set of binary plots proposed by *Whalen et al.(1987)* to distinguish A-type granitoids on the one hand from ordinary/fractionated I- and S-types on the other.

In total 12 diagrams are plotted split into two pages. Apart from fields for I and S type granites ('`I & S`'), sometimes split into ordinary ('`OGT`') and fractionated ('`'FG'`')domains, average composition of the A type granites (labeled '`A`') are shown. See Figs 1, 2 and 5 in the original paper *(Whalen et al.1987)* for comparison.

The following diagrams are plotted: $Zr+Nb+Ce+Y$ vs. $FeOt/MgO$ and $(K_2O+Na_2O)/CaO$; $10000Ga/Al$ vs. K_2O+Na_2O, $(K_2O+Na_2O)/CaO$, K_2O/MgO and $FeOt/MgO$; $10000Ga/Al$ vs. Zr, Nb, Ce, Y, Zn and Agpaitic Index.

Value

To the matrix '`WR`' are appended two columns, with Ga/Al ratios and values of the Agpaitic Index (labeled 'A.I.').

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

`plot.txt`	logical, annotate fields by their names?

Details

A series of triangular diagrams with apices Th-Hf/3-Ta, Th-Hf/3-Ta and Th-Zr/117-Nb/16, proposed by *Wood (1980)*. Following fields are defined:

IAT	*Island-arc Tholeiites*
CAB	*Calc-alkaline Basalts*
N-MORB	*N-type Mid-ocean Ridge Basalts*
E-MORB	*E-type Mid-ocean Ridge Basalts*
WPT	*Within-plate Tholeiites*
WPA	*Alkaline Within-plate Basalts*

Value

`sheet`	list with Figaro Style Sheet data

`x.data, y.data`
: Th, Hf/3 and Ta in ppm recalculated into two dimensions

Note

This function uses the plates concept. The individual plots can be selected and their properties/appearance changed as if they were stand alone Figaro-compatible plots. See `Plate`, `Plate editing` and `figaro` for details.

Examples

```
#plot the diagrams
plotPlate("Wood")
```

`zrSaturation` *Zircon saturation (Watson + Harrison 1983)*

Description

Calculates zircon saturation temperatures for the observed major-element data and Zr concentrations. Returns also Zr saturation levels for the given major-element compositions and assumed magma temperature.

Usage

```
zrSaturation(cats = milli, T = 0, Zr = filterOut(WR, "Zr", 1))
```

Arguments

`cats`	numeric matrix; whole-rock data recast to millications
`T`	assumed temperature of the magma in C
`Zr`	numeric vector with Zr concentrations

Details

Calculates Zr saturation concentration at a given temperature. Given 'T' is the estimated absolute temperature (K) of the magma and 'M' is a cationic ratio:

$$M = 100\frac{Na + K + 2Ca}{Al.Si}$$

it can be written *Watson & Harrison 1983)*:

$$D_{Zr} = e^{(-3.8-0.85(M-1)+\frac{12900}{T})}$$

The Zr saturation level is then given by:

$$Zr.sat = \frac{497644}{D_{Zr}}$$

On the other hand, the saturation temperature can be obtained from the observed Zr concentration and magma composition (assuming no zircon inheritance)

$$D_{Zr} = \frac{497644}{Zr}$$

$$TZr.sat.C = \frac{12900}{ln(D_{Zr}) + 3.8 + 0.85(M-1)} - 273.15$$

Value

Returns a matrix 'results' with the following columns:

M	cationic ratios
Zr	observed Zr concentrations
Zr.sat	saturation levels of Zr for assumed temperature
TZr.sat.C	zircon saturation temperatures in C

Plugin

Saturation.r
